>this weekend, but that's nothing compared to workstations - 20Meg is not
>uncommon at all.

The idea of a GUI is *NOT* shere power. That is for Mathematica and
such things.
The idea of a GUI is to provide a use interface which people find
acceptable. This is something X fails to do. It may be powerful but it
would run far better if it where coded better.
If you want my idea of a good GUI try the RiscOS 3 WIMP on and A310
(outdated (by arch standards) and floppy-only machine). It still runs
like a dream and its just as adaptable as X-windows (if not more).

PS I've used X on a SPARC 2 through an X-terminal and I hate it.
Its not just slow its ugly and unusable.

>Warwick
>ps. X is the GUI of choice for Silicon Graphics machines.

You only choose something like that when there are no other options.

Sversion() returns the GEMDOS version number, *not* the TOS version number.

> WHICH FILE WASNT FOUND??

No idea. Forget about Mercury, get Hermes (current version is 1.03).
You don't have to use that login.prg, just set the env vars LOGNAME and
FULLNAME to your login and real name (login name as found in the passwd
file) and Hermes will do all the rest for you.
E.g., I have set LOGNAME to "wr" and FULLNAME to "Wolfram Roesler",
see this msg's header for the results...

BobR,

That's great that you got a SuperVGA card for $79 as you said, but,
while 1024x768 may be high rez, 256 colors doesn't make it high rez COLOR.
High Rez color is 24-32bit color nowadays. WIth the march of
technology, now 8bit and possiby 16bit color are becoming "low-end."

Pattie Rayl (Atari Interface)

4904. Music Studio for Atari ST around? In B/W systems?

Hello. I have a problem. Before I got my Atari Mega 4 mono system I used to work on a friend's Atari wth color and Music Studio program.

Made some songs on that and never got around to buying the program when I got my Mega 4 because the program did not work incolor. Then my friend also moved away after selling his Atari.

Now I have various .sng songs that I would like saved as MIDI files that I can use on the Mac Any suggestion?

Is Music Studio still a product in the market? DId they ever have a B/W compatible version?

Help !

I have 1 meg simms in my ST I bought from the Chip Merchant in San Diego
for $39 each (I think they're down to $36 now). I think they are 90 usec
but for an ST anything under 120 (?) or 150 (?) is ok.

Phew, chill out, Jonathan. If you read my article again, you will realize
a) you wouldn't have to buy a super-vga monitor if you didn't
want the high-rez
b) if they remove some of the highly-specialized hardware and add
high-res colour, the net price would not change much at all.

> I'm not sure if you've been paying attention, but Atari's been working
> very hard to strengthen it's one remaining toe-hold on the US market
> which is computer music.

Tsk, tsk. More cheap shots. A little decaf, guy :-). Oh, and I have
been paying attention. I am well aware of the MIDI niche market.

> Audio jacks, a DSP processor and 16 bit audio in the next
> generation machine indicate that Atari is putting their money where
> their mouth is.

In general, this is a nice sentiment, but IMHO Atari's niche market
in music is the *MIDI* market. The DSP and 16-bit audio is a quite
different market, that of direct-to-disk recording and soundtrack effects
work, which I think is a tiny portion of the Atari music market (if someone
has some useful data to prove me wrong, I'd be very interested). I'm
getting tired of everybody drooling over DSP's for music when they
don't even know what they're good for (not you in particular Jonathan,
speaking in general).

> I was not aware that they were pursuing the video
> market. Besides, I'm sure that the DSP section would be very useful in
> video processing.

This is pretty funny, from someone who's been paying such close attention
to the Atari market. Ever heard of DTP? That's like Calamus SL, Pagestream.
Ever heard of CAD? That's like DynaCADD. Ever heard of X servers and Motif,
which requires a large screen? No, I guess you haven't. Oh, you're
"sure that the DSP section would be very useful in video processing"?
Really, Explain how the DSP will help in getting high-res colour video,
you said you were sure.

> Atari has some choices to make. If they want to have a state of the art
> audio computer at a reasonable price, they had to leave some things out.

An audio computer? See my comments above about MIDI vs. digitized samples. I think Atari could improve their "audio" by reworking the interrupt structure of the ST so that mouse/keyboard interrupts don't interfere with MIDI. This would make it unnecessary for sequencer authors to rewrite all the damn interrupt code in the OS to make MIDI work. This would result in more and better MIDI software.

> You can't please all of the people all of the time, but you damn well
> better not piss off your core market.

Explain how 16-bit digitized sample capability and the DSP will affect the Atari core market, really, I'd like to know. You seem to know all about it.

> what you want. I however would like to not trash my FATs when using
> both computers.

That would be nice, wouldn't it. 8^)
These TSR's effectively work as ramdisks, reading and writing sectors
over the midi ports. When one writes its cached version of the file
allocation table, you can kiss that disk goodbye, because it won't have
any idea of what the other has written to the FAT.

What you really need to do is to intercept the GEMDOS calls before they're
converted to sector read/writes. This is a LOT more work. I marketed
such a system several years ago, but stopped because there wasn't
an adequate market.

> I hear that MultiTos will do automatic file locking,
> does MiNT do that yet? If so, I'll just run these programs in the
> background somehow (they seem to be TSRs) under MiNT. Any comments on
> this scheme?

This won't help you at all. By the time the Mx2net driver receives the
call, all notion of files has gone out the window. It only knows how
to read, write, and trash sectors.

[RE: Elvis environment variables]

I found that I had to set the TERM variable (to vt52 I think) and the TEMP variable to some directory on my hard drive (F:/tmp). I run Elvis under neodesk, so I used neodesk's "set environment" function to do this.

I think that there is a PD or Shareware program called setenv that you can get from the various archive-servers that claims to be able to set the environment from, say, the AUTO folder.

warwick@cs.uq.oz.au (Warwick Allison) writes...

>You also need to set TEMP (or TMP) to a temporary storage directory.

>Elvis is VERY fast.

How big of a RAMdisk would you need to set up for this? Would it need to be as big as the largest file you want to edit, or would the temp file continue to grow, without bound, as you continued to make changes during the same Elvis session? What recoverable RAMdisk is considered "best" these days (I think I have eternal around somewhere).

>
> Try atari.archive.umich.edu.

The files at a.a.u.e seem to be the ancient and buggy version-1 release of
the Independent JPEG Group's software. You DON'T want that version.
What you DO want is version 3, which is available from the IJG's official
archive site, ftp.uu.net, file /graphics/jpeg/jpegsrc.v3.tar.Z.

If you have no FTP access, you can retrieve the source from your nearest
comp.sources.misc archive; version 3 appeared as issues 1-18 of volume 29.
(See the "How to find sources" FAQ article, which appears regularly in
news.answers, if you don't know how to retrieve comp.sources.misc postings.)

If anyone knows the a.a.u.e archive maintainer, please ask him/her to flush
v1 and install v3 instead.

v3 is faster, less buggy and more portable than v1; it has a MUCH better
color quantizer for GIF output; and it supports Targa image file format as
well as GIF and PPM. I'd really like to see all copies of v1 stamped out...
not to mention the pre-v1 beta releases that somehow got out on the net.

tom lane
organizer, Independent JPEG Group

From: Marc_Crompton@mindlink.bc.ca
Message-ID: <11925@mindlink.bc.ca>
Source record: 222393

HELP!
I seem to have locked up a database file on Superbase. There are close to 1200 records in the file that I'm running in a RAM Disk and I can't save or remove any records. I've tried to run it off of a floppy and I have the same problems, so I am assuming that memory is not a problem. When I try to save or remove a record, I get a "problem positioning in data file" error. I tried to remove all the data into a sequential file and import it back into a clean file but I discovered that Superbase doesn't like commas in fields when trying to do this. I am willing to change all the commas to periods to try to continue my attempt at saving my data but would like to know if there is a better way around this! Does anyone out there have experience with this kind of a problem? I would appreciate the help!!

Cheers, Marc

> Its not just slow its ugly and unusable.

I rather think that you're missing one of the main points of X. It
wasn't designed to provide a GUI but rather to provide a method of
graphical interaction between a process and a user with a display, where
the two may be anywhere from being on the same machine to being two
different machines in different continents running different operating
systems.
If you want to compare GUI capabilities, then it's the Toolkit/Window
Manager packages that you ought to be comparing with the RiscOS 3 WIMP,
not X, which is something quite different.

PB> -paulb

You must use binary mode, otherwise zmodem stops at the first ^Z byte. ARC
files are automatically recognized as binary by zmodem but not lzh or zoo.
I think it is time to get zmodem into the real world.

Well, I think that 1024x768x4bit is not strongly recommended. I would be pleased if it just had 800x600x8bit (256 colour). Always remember that big resolution uses up a large amount of memory! I don't want to need a whole harddisk-medium for just one picture :-)

My great wish is (and that of many others I know) that there should also be a version of the Falcon with an external Keyboard and a desktop case which is big enough for future cards, disk & harddisk drives, etc. This version may cost a few bucks more, but *I* will rather pay that money than put my Atari in a PC case *again*!!!

I also agree that the way the Falcon is going to be configured, advertised and shipped, it will bring Atari to the top again or it will go down in flames. My hope is that many computer game corporations will write game conversions from the PC and Amiga for the Falcon. As we all know, Lucasfilm Games didn't release Indy4 and Monkey Island 2 just because they would have to draw the whole graphics anew.

Atari Corp., please make it possible!!!

Hopefully,

Oliver

It sounds like a bug in Superbase - I think I have heard of this type of thing happening before. Without knowing the file format it is difficult to do anything, apart from what you suggest. For God's sake don't change all the commas to periods by hand though - use the search and replace feature of an editor or word processor. If you use a word processor make sure you save as ASCII or equivalent.

Hello

I have a Mega STE and I would try the new version of uemacs 3.11. But, there
is a problem. In fact, It's imposible to start me.prg the first time. I must
reset my atari or start me.prg several times. Could you help me about this
problem ? Perhaps I'm not alone !!! (I give a precision : I have tried to suppress auto
programs and accessories : The problem is the same ....! So ...)

Thanks in advance ...

Didier

If I was in charge of Atari I would organise a competition for a) The best Falcon game and b) The best Falcon serious application with a prize of 1 million dollars for each. Both pieces of software would then be given away with the machine.
The publicity from such a competition would be very good for Atari, but more importantly, the competition would produce a killer game and a killer application that would sell the machine far better than Atari ever could, a bit like the way Super Mario Bros sells Nintendo only more so (OK, so SMB is

crap, but it has been hyped up so much the public think it is good). In addition all the games and applications from the runners up would provide an excellent software base for the machine before it was even released.
Two million dollars might sound alot for Atari to spend, but they could recoup it over the first Christmas the machine was on sale, and it is nothing compared to what they have wasted (on machines like the Abaq).
If Atari want to use this idea, they are welcome to without paying me.

Okay, I must be careful now, 'cause Piet van Oostrum is quite a TeX guru, but I think it's not a good idea to use excessive magnifications of small fonts. Different pt sizes are NOT just magnifications; METAFONT uses really different font description programs for different sizes. Magnifying should be used only if the result is (what's the word for this?) "unmagnified" afterwards, to simulate higher resolution, or as a last resort.
There is a special macro package called "SliTeX", with which much bigger fonts can be used. It's described in the LaTeX manual by Leslie Lamport. Try this first before you force TeX into making ugly pages.

Okay, here's some figures: 1024x768x4=3145728 bits (384 K);
800x600x8=3840000 bits (468,8 K) so the latter would consume even MORE
RAM than the former!

My idea: if the Falcon would have MultiTOS, you'd want to run several
progs in separate windows. So I'd like a 1024x768 MONO res for this.

>
[stuff deleted]

A bit of simple arithmatic will show that a screen of 800x600x8 will use
480000 bytes, while a screen of 1024x768x4bits will "only" use 393216 bytes
(about 20% less). The 256-color picture will probably look 200% better though.

I don't think you should look a the resolution as such - in terms of a fixed
800x600 picture. When working with a GUI like GEM high resolution is essential
- the more pixels the better: On a 1024x768 desktop you'll have enough room
for a 800x600 graphics window plus icons, menubar, smaller windows...
1024x768 won't work very well on a 14" screen, I give you that much, but it'll
work just fine on a 20" screen. So for all those people out there who own a
large monitor, why shouldn't there be a 1024x768 mode?

Ciao, Stefan

Many versions of Zmodem default to text mode, in which Unix line enders
(lf) are converted to TOS/MS-DOS line enders (cr-lf pairs). If this
is your problem, any binary files would be corrupted. See the docs for
Zmodem on your mainframe, or try passing the -b argument.

From: cpw8034@zeus.tamu.edu
Message-ID: <12MAY199211072420@zeus.tamu.edu>
Source record: 222307

Well, I've tried to get my ole AtariST up and running by posting alternative OS's (Mac and IBM emulators). But the fact is that they're way tooooo expensive for the kind of performace they return. REALLY, these Atari.ST, Atari.8Bit, and Atari.Tech are the only places I've heard ANYONE talk about Atari's!!!!!!!!!!

I'm here at college and we ~had~ an Atari group but have now vanished. There are tons of IBM and Mac groups with one devoted group of AMIGA users. Check this out: Our Kroger's here in this small town has enough Amiga's and Toaster Video stuff to rival the ones in big cities like Houston. The AtariST dealer here even started to carry Amiga stuff!!!!!

What's going on here? Well, I think I'm going to just chuck my ST and do the Amiga or IBM 'thang'. (no macs PLEASE! :) I'm sick of hearing "hacks" to up the memory capacities of ST's and needing to get some mongo super ST in order to get some of the now STANDARD options on other computers.

It seems that Macs dominate Desk Top Publishing...
IBM's dominate CAD and technical analysis...
Amiga's dominate Desk Top Video and Animation... games too?
And if not the Amiga in games then you have the 16-bit game engines...

SO WHERE IS THE ATARI'S ~~~ANYTHING~~~ ??????????????????

I'm feed up and if you think so, or not, tell me what you think.
{ Otherwise, my ST's OUTTA HERE!!! }

VS> Lamport. Try this first before you force TeX into making ugly pages.

1. He was asking how to use cmr10 scaled 9.999

2. Basically you are right that magnified fonts are not the ideal solution.

3. SliTeX does not use cmr, only sans serif fonts.

4. SliTeX uses exactly the magnified method for its fonts, not the properly
designed ones. this is OK for SliTeX I think because these characters
are not printed but projected, which is a kind of "unmagnification"
anyway (because of the distance).

5. There are no standard definitions of cmr for this size (not by Knuth
anyway), you might be able to use John Sauter's parameter generation
metafont files, but I don't know if these work properly at 99.99 pt.

6. The standard font definitions of LaTex use magnified fonts a lot.

Regards,

>
>Help !

You might want to check MIDI Music Maker (whatever the latest version happens to be, 2.0 is the latest I've seen at the atari.archive.umich.edu FTP site.) The program will import Music Studio files and others. Here is a brief section of the 2.0 documentation.

1.2 The following thirteen basic file types can be played by Midi Music Maker:
1. Music Studio, Music Studio 88 Atari ST
2. Music Construction Set Atari ST
3. EZ-Track (single track) Atari ST
4. Standard Midi Files (format 0, format 1) all computers
5. Sid Player Music including stereo Commodore 64/128
6. Master Composer Commodore 64/128
7. Advanced Music System (I and II) 8 bit Atari
8. Antic Music Processor 8 bit Atari
9. Midi Music System 8 bit Atari
10. Orchestra-85/90 Color Computer
11. Lyra 1 and 2 Color Computer
12. Adlib IBM PC
13. Cakewalk IBM PC

1.3 Midi Music Maker can also create Standard Midi File format 0 and format 1 files from any of file types listed in 1.2, even from the SMF files themselves. The files created will include the settings that you have control over with this program.

1.4 The basic requirements include an Atari ST or STe with 1 meg of memory, a midi synthesizer, and some music files. Midi Music Maker runs only in medium and high resolution. The music will play through the ST speaker but a synthesizer with full midi capability is needed for best results. Some songs may use up to 16 channels simultaneously or may put up to 8 notes on a single channel. A synthesizer capable of handling the larger number of notes and channels is required for these songs.

```

HELP!!! When I try to print out my nice new document the boxes are printed very nicely....but the text is not in them!!! They look very pretty, but empty! It seems as though it may be some form of GDOS problem, I wouldn't know! Another bizaree thing, when the print status box comes up the text below it shows through, well some of it does anyway...weird! Anybody experienced a similar problem, please post or reply to address below...thanks in advance for any help!

Cross-posted to: comp.sys.atari.st,rec.synth

Hi. This is a request for all MIDI programmers out there. I need
file format specs for standard MIDI files, 0 or 1, whichever is easiest.
I am going to be working on an independent study artificial intelligence
composition program and I need to have the computers "compositions"
played through my keyboard. I am using an Atari Mega ST 2 along with
a Roland D-10. Atari users, if you know the C bios or xbios code to
do this, please send it to me!!!! Responses via email please!!
Thanks!

Let's be very realistic here folks. Wouldn't most of us be _thrilled_ just to have an Atari with equivelent VGA graphics (640x480) with 8-bit, 256 simultaneous colors? That's the minimum color graphics standard in use today by both PC's and Mac's and would surely make Atari conversions of a lot of software out there both possible and feasible for developers. And Super VGA is an easy step up from that.

Let's hope that VGA graphics are the minimal standard in the Falcon out-of-the-box and that 16, 24, 32-bit color options are made available via an add in card of some sort. Of course, the expected old-style 1040 type case will restrict if not eliminate such graphics cards. Then again, if the thread that says this Falcon 030 is the el-cheapo forerunner to an 040 serious use machine, maybe it will all work out. I for one would like to see any Falcon in a new case with some expansion options even if it would add another $100 or so to the end-user price.

Guess we'll just have to wait and see, right?

cpw8034@zeus.tamu.edu (CHI PIN WEN) writes ...]

{ a bunch of stuff ... go back and read the original if you care. }

I've read the posting three or four times, and I can't figure out the complaint. What do you want to do with your computer? I can't tell.

The only message that comes through has something to do with ``domination.'' The concern is misplaced. Computers are tools. They are not participants in a mud-wrestling contest. Is PageStream, Calamus or Didot going to break because they discover that the Mac ``dominates'' desktop publishing? Is DynaCADD or GFA Draft Plus going to refuse to run because the PC is more popular*? For most major applications, excellent software is available for the ST at prices that tend to be significantly lower than similar applications on other platforms.

If you are having trouble finding ST software in your town, then you should subscribe to any of the six or so ST magazines that carry advertising for mail-order supply houses. You may find, however, that the majority of your software needs can be fulfilled by the free software at atari.archive.umich.edu and on GEnie.

If you have a specialized need, you may find that another computer is a better solution. For desktop video, the Amiga/Toaster combination is the right way to go. If that is the case, then you should sell your ST and get different hardware.

I didn't feel like d/l'ing a 1.4 meg file (gcc21b02.zoo) so I found it split into 4 parts in atari/gnustuff/tos/gcc21 (or something like that) at a.a. and got those..
Now, WHAT DO I DO WITH THESE THINGS !!!!
I now have 4 files (rather large ones in fact) with extensions of .zaa, .zab, .zac, .zad. How do I put them back into a single archive ? Is this some "special" format ? (I tried cat'ting them & didn't have any luck.....)

Help.......

(& yes, I DID set the mode to binary when I ftp'ed them & d/l'ed them to my ST & NO, there isn't a file there expalining what to do with these files..)

BART has been broken for the last few days.

At 3:27am on May 7th, BART started crashing with every successful order.
I'm a bit puzzled since I haven't mad any changes to BART since March 6th.
I haven't determined what changed to make BART crash. I'm going to look it
over with the a.a sys-admin this evening. Stay tuned for further news.

Another possibility is that you don't have a full 8-bit data path (ex.
the system is using parity or otherwise stripping off the 8th bit).
Turn ZModem logging on for the host (usually "rz -vvv" will do) and see
if you get CRC errors or timeouts reported in your "rzlog" file (stored
in /tmp on Unix versions of rz).

I don't know if it's just my biased perception, but it does seem that
the ST's have wonderful free software support as compared to other platforms.
If that perception is true, I'm sure it's probably a result of the fact
that the ST is a less 'commercial' platform. Since it's not as easy to make
money in the ST world, and since the Mac and PC markets are already saturated
by the 'big guys', it seems there is a much higher quality of free software.

Any thoughts?

4944. Can Atari read SPARC floppies? How 'bout the other way around?

Newsgroup: comp.sys.atari.st
Date: 1992-05-12 21:32:54 UTC
From: deej@cds8613.Cadence.COM
Message-ID: <1992May12.213254.4789@Cadence.COM>
Source record: 222331

Hello again. *This* time, I may not have quite as easy a question to answer (all previous ones have been answered in record time - kudos, folks!). What I'd like to do is to find some way to transfer info contained on a floppy that was created by a Sun Sparc to my Atari ST (hi-density drive on an upgraded 520ST). Is there any easy way to do this? I was thinking *maybe* I could just write to the Sparc using tar, then read off the floppy and untar the result - somehow - but I don't yet have Atari-tar, so haven't tried it. Has anyone successfully transferred info from one system to another in this way?
I'd also like to be able to go the other way - Atari to Sparc, so if you have any good suggestions there...

Source record: 222339

It would be nice if someone in a position to make official statements from Atari put up a statement now and again. Maybe something about the schedule for already-announced products (for that matter, even a list of available products and officially announced products. Is Multi-TOS officially announced?). Maybe some stuff on compatibility of software with various set-ups. I'd envision this as a periodic update, based on having followed the newsgroup and having followed internal Atari stuff. Maybe once a month. Flames cheerfully ignored; followups could be directed to alt.swedish.chef, and the posting account could have incoming mail disabled, if nobody is thick-skinned enough. If nothing else, it would cut down on rumors.

From: azog@thoth.rent.com
Message-ID: <1992May12.215343.16528@thoth.rent.com>
Source record: 222273

I finally got the docs for Uniterm, so I could use the scripting language that seems to be built in, but when I started trying to use a script, nothing much happens. I have alt-1 dial my machine (thoth), and have the macro set as thoth.mac, which resides in the same directory as the Uniterm executable. But the macro never really kicks off. All it does, real fast, at the bottom of the screen, say something to the effect of 'executing thoth.mac' and ends. This is my script, minus my password :-)

```
%WAIT (20000)
%SEND (13)
%GET ("login: ")
%SEND ("azog")
%SEND (13)
%GET ("password:")
%SEND ("")
%SEND (13)
```

According to this, and the docs, this would wait 10 (?) seconds, send a return, wait for te login, send my username, and a return, etc... BUt it doesnt work... Anyone any ideas? btw: its v 20e

Thanx

I remember the guy... (he didn't know the difference between Sys V and BSD !)

I asked him for some info on the TT, Unix and using the VME bus (compatability issues), gave him my email address and he said that he would find out the info and mail it to me, apparently some people at Atari UK have indivdual accounts on CIX these days. Neadless to say I'm still waiting for the infomation... you can draw your own conclusions as to wether Atari UK want to support a complex thingy like Unix given to them from head office.

Well, I believe the contrary... because the bigger platforms have more users
we have a higher potential that more of them will write software freely
distributable. Just log on to your FTP sites and you'll see mountains full
of IBM and Mac stuff...

Alan

!!! FOR SALE !!!!

Atari Mega 2 ST with the following:

2 meg ram

TOS 1.4

1.44 meg internal 3.5" floppy

DS/DD 3.5" external floppy w/software to format 840K disks

Multisync monitor switch for any multisync monitor <-> ST

Battery backed clock/calendar

Also available separately or included with above:

USR HST Robotics 9600 modem------ $200

ICD AdSCSI Micro host adaptor (internal HD host for Mega)

120 meg Imprimis SCSI 3.5" hard drive 1/3 height

(mounts internally in Mega ST)

20 meg Seagate SCSI 3.5" 1/2 height hard drive (17 meg good)

Roughly 550 disks of games, utilities, desktop publishing, PD,

commercial, CADD, etc. software and manuals !!!

(list available if interested)

3-120 disk capacity cases and 1-260 disk rolltop case

I am getting out of the Atari ST computer world to pursue other

hobbies. This is an excellent system and is totally functional

(guaranteed !!). If interested, please call (812)866-4681 and

leave a message on the answering machine if I am not available.

If I sell part of my system, I may not be able to call any boards,

so please don't leave Email as I may not be able to respond.

I will consider any and all reasonable offers. The more

you want, the better the buy as I would like to sell this as

a package, but I can break it up if preferred.

Thanks !!

Randy Warner

Source record: 222332

In article <A1721243820@thelake.mn.org> steve@thelake.mn.org (Steve Yelvington) writes:
>*The popularity of the PC is a measure of gullibility, not of utility.

You almost seem to be guilty of the same name-calling the original poster engaged in. What's so bad about PC's? Two main things: 1) brain-damaged memory managment 2) Intel chips are annoying to program.

Most popular applications now support EMS and/or XMS, so #1 doesn't really affect users. Since there are BIOS calls to get EMS/XMS memory, it doesn't have to affect programmers (much) either. #2 certainly only affects programmers, and many have learned to live with it.

Point? Unless you're a hobbyist programmer, PC's are really just fine. I like my ST a lot, but it's nice to be able to unzoo and compile at 14 MIPS instead of watching the dots creep across the screen or waiting patiently for GCC to compile a 100 line module, and to know that whenever the next whiz-bang graphics standard comes out I can just pop in a new card.

The applications are often better too; borland's debugger is simply incredible! In general, it seems that PC applications are more "highly evolved" than their ST counterparts (though there are some notable exceptions; no flames on that please). And no wonder; PC applications have about 80 times the user base. (read: 80 times the free beta testing) And PC companies can actually afford things like toll-free tech support, doing real upgrades, etc.

Just look at Apogee. They're a shareware games company, for God's sake, and they have a toll free order line and take credit cards!

There's also the compatibility issue. To take just one example: on the ST, every compiler manufacturer has its own link format (virtually). This makes writing libraries that can be used with all the major development environments a hideous nightmare, which is one reason there are no such libraries for the ST. In the PC world, however, the presence of behemoths like Borland and Microsoft (granted, often a BAD thing) forces compatibility: compliance with the Borland or Microsoft standard. The end result: lots of nifty libraries for doing just about anything you'd want to do, with YOUR favorite compiler.

And don't forget the open architecture vs. closed architecture sticking point; the Atari ST probably wouldn't be obsolescent right now if you could put cards in it. But since it's a closed architecture, we're doomed to have only 320x200x16 graphics and a truly pitiful sound chip in our 520's until the end of time. (Sure, you can hack on an "upgrade," but adding anything non-trivial without an open architecture

is always dodgy. My ST's been flaky as hell ever since I added that cheesy "solderless RAM upgrade." It took a local hardware guru about 10 hours to "fix" it so that it was well-behaved.) And if I see another abuse-the-cartridge-port add-on, "I think I'm gonna hurl." :-/

Lastly, PC's are enormously more cost-effective. Atari should have changed their motto to "Yesterday's hardware at today's prices" back in about 1987 when other vendors started coming out with 68020 and 80386 machines. The TT is absurdly expensive compared to the PC competition. The Falcon (if not mythical) may help Atari regain some of their lost market share, but PC's will still be US$100 per MIPS, and that's going to be really hard to beat without using all off-the-shelf components.

>*The popularity of the PC is a measure of gullibility, not of utility.

Again, I've been hacking seriously on my ST since 1985. I've had a 486 machine for about 6 months. I'm typing this on the PC -- it usually wins out nowadays because it's so much faster. If I could buy an Atari machine that would run at 14 MIPS, do 1024x768x256, write 1.4 meg floppies, do tape backups, etc. for $2000, I probably would. But I can't see that happening unless Atari has some support from organized crime :-). In any case, the *current* popularity of PC clones (in terms of new machine purchases) is ironically due to what Atari claims THEY have: "power without the price." The only gullible people are the ones who pay more money than necessary to run their applications.

```
The following software is for sale...
$9 for 1st disk, $8 for 2nd disk, $7 for 3rd-100th disk
Or $180 for the bundle...That's less than $5 a disk
All have docs.

Baseball by Gamestar Label Master
Chess by Psion UIS III
Skyfox Turbo ST
SDI Data Manager
Artic Fox
Joust
Captain Blood
Space Quest
Star Trek
Phantasie
Kings Quest III
Advanced D&D
Terrorpods
Obliterator
F-15 Strike Eagle
Forbidden Quest
Major Motion
ORGE
The Pawn
Star Raiders
Super Cycle
Temple of A.T.
Xevious
Deep Space
Chopper X
Drakhhen
Battle tech
Space Quest III
Barbarian
Chrono Quest
Hacker II
The Crimson Crown
Rings of Zilfin
Ultima III

If interested please reply here or call me at (303)-494-8079
Thanks,
Jonathan

4954. 520st,Color Mon,Disk Drive for sale

Newsgroup: comp.sys.atari.st
Date: 1992-05-13 02:55:00 UTC
From: v5914ane@ubvmsb.cc.buffalo.edu
Message-ID: <Bo62p0.JEu@acsu.buffalo.edu>
Source record: 222336

For Sale :

Atari 520st
Atari Color Monitor (sc1224 I think)
Atari External SS disk drive (I dont know the #)
Atari Mouse (you need this for 520)
And A couple of disks of software (not much though)

All for the Low Price of $250.

E-mail me at this account. V5914ANE@UBVMSB.cc.buffalo.edu

4955. Well said...

I think Dave Baggett said it best with:

"The only gullible people are the ones who pay more money than necessary
to run their applications."

But you also should add a bit on just the sheer (sp?) fun of operating
a good operating system and expanding a machine.

All I know is that I can't stand the 320x200x16 display any more than
I can stand have to buy a new monitor just to see the mono hires screen.
The OS is sluggish and I can't get enough ram inside the thing to save
my life...

Alan

4956. Re: Atari's STILL here?!?

Source record: 222340

Unless you like pagestream and such.

If I liked my ST (I do) I'd buy a monitor card (I have a monitor that'll do the trick) and an Accellerator.

I'm looking to spend about $3000 on a "Home brew" machine. But I'm gonna like it a lot more than I'd like a Mac ($6000? for a good FX) or a PC.

Chromax or CrazyDots will both do 1600 x 1280 in Mono (not CERTAIN about Chromax really) and their color modes allow 1024x680 or better.

And an SST (or the expensive (not mini-turbo) FAST Technologies accellerator) at 40+ MHz will get me more speed than I'll need for a year or more.

It's possible. I DO like Pagestream. The ST is "Elegant in it's simplicity" and can do a LOT with a bit of horsepower. Too bad that the cheaper Ataris havn't had it (horsepower). I hope they will soon!

4957. Re: A320 Airbus by Thalion - Help with Logbook

Newsgroup: comp.sys.atari.st
Date: 1992-05-13 04:32:11 UTC
From: reynolds@panix.com
Message-ID: <1992May13.043211.2034@panix.com>
Source record: 222252

I haven't had that problem, but I haven't used A320 intensively yet because of a couple of other problems I'm having. One minor problem is that I'm very rusty on IFR navigation (I log more F19/Falcon hours than IFR hours and the A320 the manual is worthless) so I'm busy brushing up with Flight Simulator and the Western European scenery disk. The only good thing about the A320 manual is that I'm going to follow the Lufthansa training scheme.

The major problem is that I can't tune in the radials on the NAV radios. The manual says that <Z> and </> tune NAV 1 and <ALT left> and <Amiga left> tune NAV 2. <Z> works, but none of the other keys on the keyboard do anything. Try as hard as I can, I can't find the left Amiga on my Mega ST keyboard. :) Has anyone been able to tune the NAV radios on the Atari ST version of A320?

Source record: 222345

This is not an attempt at a "flame ender", but it seems that there's been a lot of random noise posted recently. To the new or inexperienced ST user, this these type of postings could be misleading.

Some people like to always have the latest/greatest/up-to-datest equipment. This is great if you have unlimited funds, but it seems the average computer hobbyist doesn't. I've had my ST for about 5 years now, and still use it as much as when I got it. I upgraded from an Atari 8-bit computer which I still have, and use for various things such as checkbook balancing, and downloading while using my ST.

Although the latest equipment platforms are MUCH more powerful, I myself don't have any reason to upgrade. To those who MUST upgrade to other platforms, best of luck. There are many applications that are not very well suited to the ST, but there are TONS that are.

>That's great that you got a SuperVGA card for $79 as you said, but,
>while 1024x768 may be high rez, 256 colors doesn't make it high rez COLOR.
>High Rez color is 24-32bit color nowadays. WIth the march of
>technology, now 8bit and possiby 16bit color are becoming "low-end."

SVGA 256 color is becoming the defacto-standard...

24 bit boards ARE available, but that technology is still
prohibitively expensive for most general applications, and
certainly for Atari to include in one of their computers.

The point being, if they include anything LESS than SVGA
compatibility in their new machines, those machines will be as
obsolete as if they had GTIA and ANTIC chips in them.

If a SVGA 256 color board can be obtained "over the counter" for
the _retail_ price of $79, Atari ought to be able to include
similar capabilities for far less than that.

>that was created by a Sun Sparc to my Atari ST (hi-density drive on an

Hmmm. hi-density -- i am not to sure about that one. I talk about "normal",
i.e. 720 k floppies only -- but it should go all the way with high-density
as well.

>upgraded 520ST). Is there any easy way to do this? I was thinking *maybe*
>I could just write to the Sparc using tar, then read off the floppy and untar
>the result - somehow - but I don't yet have Atari-tar, so haven't tried it.

Should work, if you have a tar on the ST which can read from the raw device
-- this is not a standard Atari trick! (Because on sector 0 is the info
what type of floppy it is, and that is part of the raw device). However,
the new gnutar might do this.
The other way around should work just as good.

>Has anyone successfully transferred info from one system to another in this
>way?
> I'd also like to be able to go the other way - Atari to Sparc, so if you have
>any good suggestions there...

Another way to go (the way i always take) is to use DOS format in the
transportation process. Format the disks dos-alike, this will make it
work on the atari end. And use pcfs to mount your floppies on the Sparc
(from sunos 4.1.1). Otherwise you can use mtools (available on good archive
sites) on the Sparc side.

You're right about some things, though. Atari ST was great when it
came out but since then it hasn't improved much. STe or even Mega STe
are not that special. The TT should be cheaper to seriously threaten
other manufacturers. I personally have faith in the Falcon. If it's
really gonna be a 68030 with nice graphics and the best sound on any
system, for the price it's said to have, it could be a winner. But
Atari shouldn't wait too long or it's name will be forgotten and

covered in dust and the Falcon wouldn't be noticed.

See? I told you I had to be careful.
Anyway I'd like to say just one more thing about LaTeX's font defs (this is, however, no ST matter anymore... but then again, this group was flooded with TI 99/4A (or whatever) postings which were even less ST matter...). I'm aware of LaTeX's standard font defs, but I must say I sincerely don't understand WHY it was implemented in that way. It just doesn't make sense to me to have normal and magnified fonts in ONE document. Not to say it's wrong (maybe there's a good reason for it). One special thing about TeX is the fact that it uses correct fonts for different pt sizes. Why would you force it into using magnified smaller ones? I think TeX normally goes up to 25 pt or something, which is about the biggest you'd use in a normal doc. So my idea was you magnify only your _entire_ doc for some reason and use magnified fonts only if you don't have the correct ones.
And another thing: Installing TeX in your HD consumes QUITE some space, the largest part of which is taken in by the fonts. Wouldn't it save considerable space to only need 100% size fonts? Why have a 12 pt font AND a 10 pt scaled 1200?

Please note: I'm not flaming, I'm just curious. Since everything related to TeX has been subject to serious thinking, this font stuff probably has its reason. (Though I know there was (is?) some (to say the least) discussion about the font selection mechanism currently used. Didn't Frank Mittelbach write a better fsm?)

From: vince@sci.kun.nl
Message-ID: <1992May13.075653.28375@sci.kun.nl>
Source record: 222347

Can Elvis cope with anything other than TERM=vt52? I'd like to use it in MW2, which offers more than vt52 (especially more lines). I tried, but it says "Unrecognized TERM type" or something. I tried everything with TERMCAPs and the like, and I get the impression Elvis just doesn't support it.

Another curious thing: In MW2 and MiNTshell (of version 9.2, Yes I know, I'll get 9.4 one of these days) when I type
%elvis myfile
nothing happens! I must type
%exit
and then I get into Elvis. When I exit Elvis, I get back to my shell!

Info please!

4965. Falcon seen at IFABO in Austria...

Newsgroup: comp.sys.atari.st
Date: 1992-05-13 09:45:27 UTC
From: yannikos@vmars.tuwien.ac.at
Message-ID: <1992May13.094527.18140@email.tuwien.ac.at>
Source record: 221783

NOT! ;-)

From March 12. to 18. there is the IFABO computer-fair held in Vienna,Austria.
On the first day, Atari showed some ST Books, TTs with Unix, Lynx's, and of
course the Multi-TOS... But they didn't have any Falcons! They had brought
a huge TV and 2 big speakers though, which seemed very suspicious! When I
asked someone from Atari Germany, he told me they wanted to show the
new Multi-TOS, and they would most probably show some Falcons at the Atari
fair in Duesseldorf (there they will be officially presented).

I still don't believe they brought 2 big speakers and a huge TV screen
just to show Multi-TOS! What'd they want the speakers for?!?

Maybe they'll show it on the last day of the fair, who knows...

BTW, the IFABO is the biggest computer fair in Austria, with some 57000 m^2
and over 700 companies... Atari had something like a 20x20m area there!

Hi chaps/chappettes,

I have a Sun sparc at work and an Atari at home (lucky ol' me).

I have no trouble writing files from the Atari on to a DOS
formatted floppy at home. I can take this to work and read
those files on to the Sun.

I can also write to this same disk on the Sun. The problem
arises on the atari when I try to read files written from the
Sun on to the disk. The files are corrupted. Not garbage, but
seriously screwed up. Looks to me like block size, but I may
be wrong. I feel sure one of you guys can sort it immediately,
or point me at a FAQ with the answer.

Thank you v. much for any assistance you may be able to throw
my way.

Yes I've had the problem but its eratic and rare to bite. Its unlikely to be
related to RAM size or Disk space although that may cause other problems.
The worst I've had to do is export the data and import to a new db.
but....

>anything, apart from what you suggest. For God's sake don't change all the

NO! Thats painful. Just get into the menu and set the separator to some
other character you don't use in your data like ; or : or + etc.
You could even use " if you turn the quoting off. Sorry I cant be more
specific but my copy's at home an I can't remember which menu its in.

> or what to do. I have never tried to DE ARC or ARC anything before,
> but have a whole lotta downloaded ARCED files on my hard drive
> which I cannot get up and running.

Well as the name of this program says, it is only a shell. You also need
a program 'ARC.TTp' to decrunch the .ARC files. The shell makes it just
a bit easier to use arc.ttp.
If you can't get it, tell me and I can send it via e-mail (uuencoded).
arc.ttp is also shareware.

>Any one know the E-Mail of Thalion in Germany?

Good question !! But Thalion has no internet access (and of course no
E-mail adress) The (old-fashioned) adress is :
Thalion Software
Koenigstr. 16
W-4830 Guetersloh
Germany

If you should have any problems with your letters (perhaps you get no response
or what ever), you can send me a mail and I will forward it to Thalion.
I worked for that company two years ago (Seven gates..., some parts of
Dragonflight) and I should be able to get response to any question.

Hi there,

I don't know that much about it, but I can sure say it's good.
I read a few things in an article of the 'ST-Computer' (a german mag)
and with the use of especially C it is supposed to be great (also
with Pascal, if I remember correctly).
Creating diaolog-boxes, Mac-Buttons, windows, etc., yeah I guess
I'll have to get I myself (as soon as I got deeper into C ...)

I haven't seen any contributions from Atari folk here for some time, whether official or not. What's happening? Is everyone busy? Has everyone left/been sacked? Are they all under contract to write only on GEnie? Or what?

I suspect a dark conspiracy. Either that, or they're all too busy playing Nintendo games.

Graham

At a guess, was the SHELL variable setup properly so that login.prg was
able to pexec the new shell ?

> WHICH FILE WASNT FOUND??
>
> It found config.sys, and it wrote current.usr, but wont go any farther!
Actually, if the current.usr has been written correctly then this is all
you need to read/send mail & news - mercury reads this file to determine
who you are so if it contains the correct entries then you're OK.

MARVIN..

You need the Arcshell version 3.1 and the 2 TTP's, one called
ARC 6.02 and ARC 512d/e from memory, there are some old archives that can't
be unpacked with ARC 6.02...

These should all be on A.A...

4977. ST Format, Third Coast, GFA, Falcon etc.

Newsgroup: comp.sys.atari.st
Date: 1992-05-13 13:15:52 UTC
From: strgh@warwick.ac.uk
Message-ID: <001jbwy1@csv.warwick.ac.uk>
Source record: 222259

The June 1992 `ST Format' has just appeared on the shelves. As promised,
it gives away GFA Basic 3.5, GFA Assembler, GFA Raytrace and various
other software. It also includes the option for subscribers to receive
the `free gift' of 2 extra copies rather than a choice of software I don't
want, so I might even subscribe to it.

As a belated follow-up to the Third Coast thread from a while back,
a reader's complaint about Third Coast (page 123) evokes the response:
`Third Coast have finally gone out of business. If you
have a claim against them, call the liquidators, Grant
Thornton on 061 834 5414. Call soon because many people
are understood to have claims against Third Coast.'
Also we read (page 124):
`Turbosoft have disappeared without trace.'
and (page 22):
`Distributors of the Xtra RAM upgrade board, Frontier
Software, have gone out of business.'

Now, the Good News.
I am delighted to see GFA Basic on the cover disk. I'm unlikely to use
it myself (preferring APL68000 & Lattice C), but it should increase the
number of (almost-)serious programmers on the ST. This would encourage Atari
to divulge information freely (or at least cheaply) rather than charge a
large amount for a grotty `Developer's kit' with a non-disclosure agreement
so that unless you buy it you can only guess at how grotty it really is.
If Atari don't encourage enthusiastic but impoverished potential `Falcon'
users, they're finished.

All IMHO, of course.

>harddisk-medium for just one picture :-)

It would be nice if the palette was expanded to a full 24-bit palette too! I think a 1024x1024x8bit display mode should accounted for, even if it is only when the machin has more memory than standard, as this is the standard display on all the low-end colour workstations these days.. Don't ask for a display which is normal today as it will definitly be outdated by the time the machihine arrives.

>Games didn't release Indy4 and Monkey Island 2 just because they would have
>to draw the whole graphics anew.

This was probably because of the low standard of the ST's colour display.. after all 16 colours on a 300x200 display is positively crude by today's standards.. and that with a palette of only 512 colours, positively archane!

Yea Right. I do log on and download Mac stuff all the time - most of it is either very old or just plain trash. I have yet to see the caliber of freeware/shareware that the ST libraries contain anywhere else! You've made your point and said you were going to leave so why not live up to your statements.

>What I'd like to do is to find some way to transfer info contained on a floppy
>that was created by a Sun Sparc to my Atari ST (hi-density drive...etc..

Some time ago i posted the same query and was told about the package
called MTOOLS, it was posted to comp.sources.misc, or alt.sources and allows
a sparc floppy drive to be configured for a number of different machines,
notably PC drives. I have used it as 720K low-density drive for some time and
have never had any problems, as long as the disk was formatted correctly and
no directories were used.

As far as 1.44MB HD disks go, i've never tried it but i'm sure that it
is included within the distribution. I'll see if i can find it on one of the
comp.sources archives and post a site and full path so that anyone who wants it
can find it.

I guess it all depends on where you look. If I'm not mistaken (and I'm sure someone will correct me if I'm wrong), the Atari ST library area on GEnie is the largest compared to the others (IBM, MAC, AMIGA). Even if it is _not_ as large, the proportion of pd/freeware/shareware available compared to the relatively miniscule installed user base has got to be greatly in the Atari user's favor.

Bottom line is that there appears to be no shortage of pd s/w for the ST! And since I have made forays into the "other" communities (Mac and PC) I can confirm that there _is_ a perceived difference in the users, too. I don't know why, but Atari users just seem to be more helpful, more dedicated, and just more FUN than my perception of the average PC/Mac user. Maybe it's just me, but that's how it seems.

I have just transferred several files this way(from SPARC to Atari).
You have to use mtools on the SPARC.The command mcopy (unix-file) (A:/atari-file) worked fine for me.It even worked with disks formatted on the ST.
Disks formatted in dos should work without a problem too.Use the command fdformat -dl on the SPARC to format the disk in dos.Hope this helps.

-Dave

Well said. IMHO: The world according to Rick. Way back during the 8-bit days we had a lot of weenies in our midst. Unfortunately we didn't recconize them because when they talked about the superiority of the 800 vs [Apple, C64,etc] we agreed with them. We should have known something was wrong when the ST cam out & they immediately trashed 8-bit users. I hope Atari DOESN'T come out with a new computer for another year so these guys will get a clone & leave us alone. I constantly ask people just what they do with their '486 & the answer is usually look & nudie GIF's & play games. Smart buy! Clones are an excellent choice for this use, but you could get by with a slower clock speed.

> brain-damaged memory managment 2) Intel chips are annoying to program.

Actually, Dave, I wasn't thinking about any issues related to programming.

I was thinking about the people I work with who have bought PCs in the last couple of years. I'm a newspaper editor, not a professional programmer, and my co-workers don't start out with an interest in what goes on inside the machine. They may have been using computers for decades, but they're still technological neophytes.

Most of them just want to be able to write, occasionally communicate with the text-editing system at work, and play a few games. I can't think of a contemporary personal computer that wouldn't be satisfactory for those purposes, so utility doesn't explain their purchasing patterns. A Mac, and Amiga, or an ST would do the job.

They're all convinced that a usable computer is going to cost them $1500 to $2500, and they're all afraid of making a mistake and wasting a big chunk of money that ought to go in the kids' college fund. So they get a PC-clone for ``compatibility'' reasons. IBM used to feed of the FUD factor (Fear, Uncertainty, Doubt). Now it's driving the whole PC-clone industry.

Pretty soon these folks are going back to the computer store -- 640K wasn't enough memory. So they get entangled in this bizarre mondo-quazmoid PC memory scheme. Believe me, it DOES affect end-users, because these folks are constantly telling me about their latest adventure with Windows 3 and QEMM, yet another trip to the computer store, and a weekend of playing detective to figure out why utility A says they have X amount of memory and utility B says they have Y amount of memory.

Then they start trying to actually get applications installed under Windows, and blow two or three nights off reading manuals and tinkering with software only to find that it locks up the computer on six out of eight attempts.

So the next thing I hear, they're upgrading to another version of Windows, replacing the hard drive with a bigger one because they got suckered into buying a word processor that chews up a couple of megabytes of space, giving away last week's videogames because they won't run on the new

setup, and so forth.

They didn't just get a computer. They got another mouth to feed.

I doesn't have to be that complicated! It doesn't have to be that expensive!

> Lastly, PC's are enormously more cost-effective. Atari should have

> components.

I agree 100% with your points about the TT prices vs. '386 PC prices. But that hardware isn't necessary for the people I work with, and the entry price is only one part of the trip.

> ... The only gullible people are the
> ones who pay more money than necessary to run their applications.

Which brings up the issue of software prices. I'm not overly familiar with commercial software prices (most of my stuff is freeware), but what I see for the ST tends to be a lot cheaper than similar PC software. And if you look for bargains, you can get some real eye-openers (such as Harlekin for the price of an $8 magazine).

Most people ARE gullible. They don't know very much about computers, they don't know where to get free software, and they think the store at the local shopping mall is more reliable than a mail-order house they've never heard of. They believe what salespeople tell them. So they wind up with hardware that isn't suited to them, software that's overpriced, and a lot of needless frustration.

Hi all

Does anybody know what happened to the long promised FSM-GDOS? I read an interview with Alwin Stumpf in a german ATARI-magazine; it states that ATARI has dropped FSM-GDOS and is currently looking for/developing something else.

Does anybody know if this is true???

Greetings,
martin

The SIMMs in the STe are standard ones, the same as used in Macs but not!
the same ones as in the STacy (I wonder what these look like).
I bought 1 meg SIMMs for 80DM (~90 hfl) on the last Atari Messe (Aug.1991).
So the 'normal' price seems a bit expensive to me and the Atari price is
completely ridicolous.

Hi

There is a set of utilities called Mtools allowing a SPARC to read
and write DOS format to 3.5" drives. Our 3.5" drives from Andataco
came with their own drivers to do the same thing. Since the ST uses
DOS format, that's what you need. Check atari.archive for Mtools.
If you can't find them, email me.

Eeek! I guess my language was a tad strong. Let's rein in our egos
and we can have an intelligent discussion. My position is that the new
low end Falcon should be designed to cover general purpose computing and
the music market, while the '040 Falcon should add the bells and whistles
(and video hardware) to support business applications. I'll try to
support this as I respond to you below.

>> I'm not sure if you've been paying attention, but Atari's been working
>> very hard to strengthen it's one remaining toe-hold on the US market
>> which is computer music.
>
>Tsk, tsk. More cheap shots. A little decaf, guy :-).

I'll brew, you pour ;^).

>Oh, and I have
>been paying attention. I am well aware of the MIDI niche market.

>different market, that of direct-to-disk recording and soundtrack effects
>work, which I think is a tiny portion of the Atari music market (if someone
>has some useful data to prove me wrong, I'd be very interested).

Atari didn't spawn a MIDI division, they spawned a _music_ division.
Agreed that so far the ST's strength in the music market has been MIDI,
and that's the reason they are starting to fall behind. Many MIDI
musicians are choosing Macs over ST's because they want the option to
move into sampling and digital hard disk recording in the future. Music

stores generally prefer not to have to support more than one line of computer, so if they want to support both the MIDI and disk recording market, they'll go with the Mac. Frankly, I don't think it's reasonable to try to separate the MIDI and audio markets. I'm a MIDI musician. I follow the GEnie MIDI roundtable and read the trade magazines, and the real action in computer music is moving toward having an integrated music workstation. If Atari can build on it's solid MIDI base and create a machine that could fill this niche, they just might have a winner on their hands. If they load it up with expensive video hardware then much of the market will just defect to the Mac, which has already caught up to the Atari in MIDI software and is ahead on digital recording packages. The Mac's sampling packages blow away anything on the ST. The reason that the NeXT (with its DSP) hasn't taken off with the music market is because of its cost: MIDI software houses won't port their applications because they don't think the average musician will shell out two or three grand for a computer. Atari knows this, and they want to capture the market that NeXT squandered. *I* would have defected to the NeXT if I could have afforded it and there was some MIDI software support!

>I'm
>getting tired of everybody drooling over DSP's for music when they
>don't even know what they're good for (not you in particular Jonathan,
>speaking in general).

Thanks for giving me the benefit of the doubt...my "day gig" is as a communications systems engineer, and I know very well what a DSP is for. A digital signal processing chip's main claim to fame is it can perform fast multiply-accumulate operations. Many also support bit reversed operations, which make it ideal for performing Fast Fourier Transforms (FFTs) which are generally the limiting factor in audio processing. I have the DSP56001 user's manual at my desk and I've been drooling at the thought of writing software to perform audio effects processing on the Falcon...filtering, limiting, delay effects, sampling and the like. Such software packages could only help Atari's position in the audio market...remember, most MIDI musicians eventually want to record their compositions, and they all can make use of digital effects and samplers.

>> I was not aware that they were pursuing the video
>> market. Besides, I'm sure that the DSP section would be very useful in

>Ever heard of CAD? That's like DynaCADD. Ever heard of X servers and Motif,
>which requires a large screen? No, I guess you haven't.

Of course I have. When you said "video" I thought you were referring to applications like Amiga's video Toaster. Do the DTP packages you mention require high resolution color (I'm not being sarcastic, I really don't know)? I use Motif on my X-server at work. I don't disagree that

Atari would do well to offer a system to keep the DTP folks happy, but I don't think that they are going to attempt to do this with their low-end machine, as I understand the Falcon is designed to be. I would think that the Falcon's 68040 based sibling would be the appropriate place for support for business applications. MIDI doesn't require the extra speed and power of a 68040, and the DSP chip takes care of the fast audio processing requirements, so I think it's appropriate that Atari focus it's low end machine towards the music market. I'd think that the DTP users would want a fast 68040 over a 16 MHz 68030 anyway.

>Oh, you're
>"sure that the DSP section would be very useful in video processing"?
>Really, Explain how the DSP will help in getting high-res colour video,
>you said you were sure.

A DSP chip is also at the heart of image processing systems, and while I don't claim to be an expert in this area, I'm sure someone who is could find applications that would make you video enthusiasts excited as well. Read the want ads for companies hiring image processing engineers; they usually call for someone with a DSP background.

>> Atari has some choices to make. If they want to have a state of the art
>> audio computer at a reasonable price, they had to leave some things out.
>
>An audio computer? See my comments above about MIDI vs. digitized samples.

If Atari wants to maintain its position in the MIDI/audio market (they are related!) they will have to start to offer more audio capability.

>I think Atari could improve their "audio" by reworking the interrupt
>structure of the ST so that mouse/keyboard interrupts don't interfere
>with MIDI. This would make it unnecessary for sequencer authors to rewrite
>all the damn interrupt code in the OS to make MIDI work. This would result
>in more and better MIDI software.

There's plenty of MIDI software for the ST, and it's generally acknowledged to be as good as or superior to software for the other platforms. If Atari wants to improve the MIDI interrupts in the new machine it's fine with me, as long as these fixes don't break the existing MIDI software!

>> You can't please all of the people all of the time, but you damn well
>> better not piss off your core market.
>
>Explain how 16-bit digitized sample capability and the DSP will affect
>the Atari core market, really, I'd like to know. You seem to know all
>about it.

To sum up, I believe that Atari can't afford to price themselves out of the music and general-purpose computing markets. Adding the DSP circuitry to the low end machine will not significantly increase the cost of the machine (probably on the order of $100: the DSP56001FC20 sells for around $50 in low quantities), whereas a computer configured

for the business market (separate keyboard, fast 68040 processor, high resolution graphics circuitry) would push the cost into an entirely different bracket. Do your concerns need to be addressed? Of course. Is it reasonable to expect these capabilities in a low cost computer? I don't think so. Make an inexpensive computer for the general purpose and music applications and make a mid priced computer for business applications.

I don't know the precise legal status of Frontier Software, but as far as products and support goes they have been taken over by (I think) Marpet [Developments, Systems, Supplies, ...]. Sorry to be so vague but I have no information to hand. I have dealt with them since the changeover and the service was excellent - a faulty upgrade was repaired and returned within days. Try ringing the old Frontier number - a recorded message will tell you the new one.

[I have no connection with any of the above companies - this post is purely for information]

>Amiga, or an ST would do the job.

Very good point. Here's the only problem I see with buying an ST
instead of a clone (for that kind of user): the closed architecture.
Yes, it's true that WordStar 1.0 which you bought for your Apple II
ten years ago might still be *sufficient*, but most people will
eventually want to upgrade. There may be a point of diminishing
returns, where added "features" only serve to make the program more
complex without adding significant functionality (can you say
"Word Perfect"?), but I don't think most ST applications are anywhere
near that point.

So Joe User might only want to edit recipes with his word processor
now, but what if he decides to become a Computer Science Theorist, and
must edit stuff with lots of squiggly Greek letters, or wants to start
a DTP business and laser print on a nice 600x600 dpi laser printer?
What's good and reasonable today won't be in five years; as hardware
improves, so do user's requirements. And people just *change* over
time, and come to want to different things.

With a closed architecture like the ST, you're locked into what you've
got. Yes, you can put an SST board in there, but hacky upgrades like
that (not to denigrate Dave Small, mind you) are always going to be
more expensive and (often) less reliable than a card slot bus.

I just wish Atari would give the Falcon cards slots and put the video
and super sound chip(s) on cards so we could upgrade them later.
There's the old adage that applications expand to fill available
memory and CPU capability. When people see nice things like Borland's
debugger (just my example of the day), or even neat games like Ultima
Underworld (which does real-time texture mapping to allow fully 3D
movement in a Dungeon Master setting), they want their ST's to be able
to do the same. It's not just a matter of "Oooh, I gotta have the
LATEST K00L (HARD)WAREZ," but "Gee, I didn't know you could DO that
with a computer. Neat. I would get lots of fun/productivity/money
by using that."

So I don't think it's fair to say that everyone who wants a fast
machine, or an upgradeable machine, is a pitiful child who drools

over the latest nifty-neato stuff in the computer store on weekends. They're just normal people, for the most part, who start out thinking that all they'll want to do is edit a few documents, and that they can live with waiting a few minutes to save their files, but then decide that it would be Real Nice to be able to do the things that Other People are doing on more powerful machines.

>They're all convinced that a usable computer is going to cost them $1500
>to $2500, and they're all afraid of making a mistake and wasting a big
>chunk of money that ought to go in the kids' college fund.

Oh, but come on. You can get a fully functional 286 machine for about US$800 mail order. The motherboards are only about US$100! If they're suckered into a 486 machine to do their taxes, they're gullible, but in a different way!

>Then they start trying to actually get applications installed under
>Windows, and blow two or three nights off reading manuals and tinkering
>with software only to find that it locks up the computer on six out of
>eight attempts.

Well, I ain't gonna defend Windows. ;-)

>Which brings up the issue of software prices. I'm not overly familiar with

You'd be surprised. Mail order PC prices aren't that bad. You can get Microsoft C/C++ now for US$139 if you "upgrade" from Borland. Similar deals make things occassionally reasonable. But YES, in general applications are more expensive. But you get real support with them, and products that work reliably and have gone throught many more debugging iterations than their ST counterparts (in most cases, anyway).

And if you think the ST shareware world is good, FTP to a PC site like garbo.uwasa.fi some time. Unbelievable, the amount of free software for PC clones. And I'd venture that the same percentage of ST software that's good applies to PC software.

Dave Baggett

Alex,
Could you tell us who a distributor is? It almost certainly
won't be available over here in North America, unless Gribniff
brings it over like they did Turbo C. How much does it cost?
Does it have English or German documentation? German docs
aren't a problem for me, but others on the net may have
a problem with that. Also, any other details you learn about it
and can tell us would be appreciated.

Thanks a lot,
Jim

>PC-clone for ``compatibility'' reasons. IBM used to feed of the FUD factor
>(Fear, Uncertainty, Doubt). Now it's driving the whole PC-clone industry.
>

Another thing that happens is that people buy an IBM because they want to
use the same software they use at work. Well that's fine but most people
that I talk to want to use the *same* software, just copy it from work and
take it home. This is illegal! This drives the cost of that computer up
a few notches. The only hindrace for buying a different computer iss that
you have to learn a new piece of software.

Considereing all the headaches I have herad from DOS/Windows poeple. A
Mac,ST, or an Amiga is quite the cost saver. I've had no major hassles with
either my ST or my fathers Mac SE. Heck getting memory for the SE is
absolutely painless. And when you bump the 4MG limit it's simple, buy
a new computer.

The DOS world has been hitting the comptuer world with the idea that a
computer has to be expanable to stay alive. I have to have lots of slots.
Need more slots. Must have more slots. Well, this isn't neccessary on
a computer which is designed correctly. The age of the base computer is
not over yet, Macs and NeXT's with no or one slot are the heaviest
sellers. Simple doesn't even have to mean non-powerful.

I think the problem is that people who have been bitten by the DOS bug
expect it to be complicated and the more you tell them it isn't the
more they think you're trying to fool them. You tell them it has all
they need and they automatically add another $xxx for this, $yyy for that,
even if it isn't necessary.

A large number of users alone does not automatically lead to a
huge amount of nice programs in the public domain. It rather
depends on how many people write programs for that machine. And
from what I see, the programmer/non-programmer ratio is much
higher in the Atari community than it is among the PC users.
The reason for this is that the PC has been a 'professional'
machine, used in business and for other "serious" purposes. Only
lately PCs are used by hobbyists and for game playing etc.
On the other hand, serious and devoted hobbyists have always been
a large fraction of the ST community. Thanx to these people,
there is a very large pool of PD and shareware programs for the
ST. They cover a lot of applications that are unparalleled in the
PC world. There, you have to buy a commercial program for these
purposes if you are serious about it.
One of the main reasons why the percentage of reasonably skilled
programmers is uniquely high in the ST community is that ST
programming is easy and fun.
The high quality of free software has lead to a considerable
pressure for the commercial developers to market their products
at reasonable prices, hence ST programs are often substantially
less expensive than their PC (or Mac) counterparts. Of course,
the unusual strong competition of PD programmers caused the
commercial developers to concentrate on other platforms. And
then, spreading the rumor that the ST is a toy is an easy way for
those developers to cause users to move to other platforms.
A problem with many PD solutions is that the programmers didn't
care about standardization for a long time. Of course, they don't
have the possibilities of commercial software developers to

establish, agree on, and enforce standards. However, it seems to me that PD programmers become increasingly aware about this.

Ok, I'll stop talking now. My message to you is: If you want your computer for prestige, the ST is not the right choice for you. But if you want a powerful computer that is easy and fun to use and to program, nothing is better than the ST!

5000. Terminal em. / cli as acc.?

Newsgroup: comp.sys.atari.st
Date: 1992-05-13 17:51:43 UTC
From: leonp@cs.kun.nl
Message-ID: <1992May13.175143.7383@sci.kun.nl>
Source record: 222284

Hello everybody, as I'm planning to upgrade my 1040 to 4 meg, I'm
looking for some neat stuff to fill the memory.
What I would really like are some nice desk accesories;

1. A terminal emulator as a desk accesory
WTERM.ACC is not what I'm looking for and I've tried
rufus as acc, but it crashes on my computer?
I would like to do terminal emulation in a window of course.

2. A command line interpreter in a window, which I can use anytime, when
I'm not using gemini. Gemini has Mupfel and I would like to have
something like that.

As all atarians I prefer pd/freeware/shareware.
Please email me if you know anything for me.

Leon

>really affect users. Since there are BIOS calls to get EMS/XMS memory,
>it doesn't have to affect programmers (much) either. #2 certainly only
>affects programmers, and many have learned to live with it.

EMS and XMS are weird makeshift solutions to overcome the 640K
border that some kretinos have created by thoughtlessly designing
DOS. (This may be a flame, but it's the truth.)
The hardware of modern PCs is ok, but the MSDOS and the like are
really trash. The PC would certainly be far better off if DOS had
been replaced by a decent OS by 1986 or so.
From my experience, your claim that the broken memory management
doesn't affect users is not true. It leads to all kinds of most
weird problems/conflicts/symptoms when it comes to configure the
PC, and this definitely is one reason why the PCs here cause much
more user problems than the STs.

>Point? Unless you're a hobbyist programmer, PC's are really just
>fine. I like my ST a lot, but it's nice to be able to unzoo and
>compile at 14 MIPS instead of watching the dots creep across the screen
>or waiting patiently for GCC to compile a 100 line module, and to know
>that whenever the next whiz-bang graphics standard comes out I can just
>pop in a new card.

You compare a 1992 state of the art PC with an ST whose hardware
has not changed much since 1985. Try a TT.
Regarding graphics, I think there's a lot available for the mega
bus. For example, we have a Mega ST4 with a graphics card for a
1280*960 mono monitor here, and it's great.

>The applications are often better too; borland's debugger is simply
>incredible! In general, it seems that PC applications are more "highly
>evolved" than their ST counterparts (though there are some notable
>exceptions; no flames on that please)

I think that for most standard applications there are better
programs for the ST than for the PC, as I have just written in
another posting. It's in the eye of the beholder whether PC or ST
programs are "generally" better.

>And don't forget the open architecture vs. closed architecture sticking
>point; the Atari ST probably wouldn't be obsolescent right now if you
>could put cards in it. But since it's a closed architecture, we're
>doomed to have only 320x200x16 graphics and a truly pitiful sound chip

>"upgrade," but adding anything non-trivial without an open architecture
>is always dodgy. My ST's been flaky as hell ever since I added that
>cheesy "solderless RAM upgrade." It took a local hardware guru about
>10 hours to "fix" it so that it was well-behaved.) And if I see another
>abuse-the-cartridge-port add-on, "I think I'm gonna hurl." :-/

Sure, memory upgrades for a plain ST are a pain, I've gone
through this too (I ended up soldering around until 5 am). But
again, that was yesterday. With a TT you just use SIMMs, just as
with a modern PC.
And I don't agree that the ST has a "closed architecture". It
just has many things built in that you need a card for with a PC.
And for many extensions, the ACSI or the mega bus are just fine
(see above).

5006. QuickST broken???

Newsgroup: comp.sys.atari.st
Date: 1992-05-13 18:43:08 UTC
From: rjwalsh@maths.tcd.ie
Message-ID: <1992May13.184308.10745@maths.tcd.ie>
Source record: 222290

Does anyone have the same problem I am having with QuickST from the atari.archive? When I run it, all the items in the menu bar overlap in the same position, and all sort of weird things start happening to text and graphics on the screen.. Is it incompatible with my vanilla 520STfm (OS version 1.09 I think...)?

Any help appreciated..

I've managed to get a couple of gif viewers(still no jpeg),but
the quality of the pictures is pretty poor.Is this just because of the
low resolution of the ST?Is there anything that can be done to the pictures
on unix before transfering them that will improve the quality?Also,since
there seem to be no jpeg viewers,is there a program for the atari that will
convert a jpeg to gif?Or would it be better just do convert it on unix
first?Any help would be appreciated.

5008. Uniterm display problems

Newsgroup: comp.sys.atari.st
Date: 1992-05-13 18:44:24 UTC
From: bgrave@ub.d.umn.edu
Message-ID: <2984@ub.d.umn.edu>
Source record: 222289

I've got a little problem.

I've been using Uniterm to log on to our Unix 4.3 to download files using
Kermit protocol. The problem is that when I run the program and
start typing in the at commands for my modem I get garbage characters...
Just one character actually. Every keystroke produces the same character.
The modem recognizes the commands and I log on normally and can download
normally but I'm doing it all blind.

When it first started happening I'd hit the right mouse button, "reset"
the terminal and it would be ok. That doesn't work anymore.

Anyone run into this and know what's wrong with my Uniterm? It's ver. 20e.

Any help is welcome.

Plan 9 from AT&T is a concept which seems to have a grasp on that, if AT&T
ever lets it out. (Maybe they will when it is obsolete.)

>
>Furthermore, if you check out the X11 sources, you'll see what I mean about
>efficiency.
>
>>Warwick
>>ps. X is the GUI of choice for Silicon Graphics machines.

NOTE: X is not a GUI it is communication protol. MOTIF or Open Look
would be a GUI. Remember the User Interface is completely separate from
the X server.

Most computer companies like Sun, and SGI(I think) initially had
a propriatary windowing environment. Sun->SunWindows
These companies have all moved to to a windowing environment which supports
all their older window environments and X.
The main reason why, (I think, and makes sense), is to allow their machines
to function w/ other vendors machines, and keep current functionality.
Goal: Broaden their environment infiltrating environments where the installed base
does not contain any of their hardware, and allowing the purchaser 3rd party options
for future hardware purchases. (Xterms, etc.)

I don't know what other windowing environment could be used that meets the
necessary requirements, other than a propriatary environment...
(Networking, multi-platform (architecture) support, multi-user, etc.)

And windows NT get away from the open system angle of things. How does a machine
with a propriatary OS fit into a network of multi-vendor multi-platform (architecture)
machines? It would easily, if it had UNIX network compatibility, and an X compatible
windowing interface.

Agreed, the MIT X server is not as efficient as possible. (In many cases)
If you have a problem with that, then run the X server sent with the OS.
EX: DECwindows is X11R4 compatible, and is quite a bit faster then the R5
MIT server. The majority of the vendors servers/libs are re-written or cleaned
up, which is the reasoning for not shipping the source.

I have seen/worked with the source code of a vendor, whom we will leave
unnamed !-), and I know this to be true. In fact the code which I worked with
looked nothing like any source from MIT.

I run the MIT R5 server on my DECstation, and it is more than fast enough, even
with only 8 meg RAM. That is a real feat, considering the enormous size
of ULTRIX. It leaves my 520 in the dust. (Not to compare apples to turtles!)

Well then, either:
- re-evaluate your network installation
- use the machine when there is less load
- get a faster machine (Sparc-2 isn't the all out
greatest machine as an X client server for
multiple xterms.)
- get a better X term.
- Or see if the X term vendor has updated software.
(We have a few NCD 68k Xterms. When we installed
the new server, there was a 15% speed increase.
IE: it's all in the implementation.)

I use a Visual 19" grey scale 68020 xterm...Can you say Snapeee!!!

>I doesn't have to be that complicated! It doesn't have to be that
>expensive!

This is the landslide the PC world is caught in. I'll admit,
the 8088s were a litle low-end (but still *very* useful). Then
the 286 became the next big thing. Then the 386. Then the 486.
Now the 586 is just around the corner. DOS is a Bad Thing,
so if you have a fast machine and lotsa RAM and 15 free
megabytes of disk space, you can run Windows, whose usefulness
is still debatable. And now there's OS/2 which needs 8 megs
of RAM and 32 megs of disk space and a speedy 486 to run.
Compilers have progressed from the orignal 37K Turbo Pascal
to Borland C++ 3.0 which eats up half your hard disk, and
Microsoft C++ 7.0 which comes with 5500 pages of documentation
(both compilers are rather error infested, BTW).

My point is that the jump from having NO computer to having
an 8086 based PC is TREMENDOUSLY larger than the jump from
such a PC to the latest behemoth 486 running the current
multi-megabyte operating system of the month. And more than
ever, no one seems to be satisfied with what they have: just
one more CPU generation and an 8.01 version of the software
and everything will be a-ok.

I'm not flaming the PC, as it is a useful machine (and I
agree with most of Dave Baggett's points). I'm more
annoyed with the "PC Magazine" sort of "It's hot! It's new!
You gotta buy it!" attitude which drives its market. The
ST world is a lot more mellow and relaxed in this respect,
which you can take however you want to...

5015. Thomas Questor LHARC gone nuts?

Newsgroup: comp.sys.atari.st
Date: 1992-05-13 20:47:51 UTC
From: cummins@a.cs.okstate.edu
Message-ID: <1992May13.204751.3227@a.cs.okstate.edu>
Source record: 222151

In preparation for a HD backup, I am compressing files. I have
a directory of Spectrum pictures (mostly *.spc) that is about
1.5Mb on the disk. When I compress it to an LZH file... the
LHARC program reports better than 80% compressed. A verbose listing
shows that the files compressed are 1.1MB or so... BUT!?! the file size
on the disk is 1.8MB!!! What's going on?

Another lharc program (XLARC1.2 I think...) reports lesser compression
and a bigger filesize when finished... (1.2 or 1.3MB) But the filesize on the
disk is the same as reported. (1.2 oe 1.3Mb)

How come T.Q. lharc 2.1h and 2.01i report decent compression and a small
filesize, but add 600k of SOMETHING to the file? Number of files
is correct and all that rot. Like I said, other Lharc programs seem to
behave normally. I'm using Arcshell 3.1, with the T.Q. mode enabled.

jc (Hellllllp!)

5016. Multi-Sync monitors with the ST?

Newsgroup: comp.sys.atari.st
Date: 1992-05-13 20:50:33 UTC
From: hutch@bellman.lanl.gov
Message-ID: <1992May13.205033.15134@newshost.lanl.gov>
Source record: 222299

I'm buying a 486/50 PC system in a few weeks (not selling out the Atari, just "expanding my capabilities") and I'd like to connect the VGA monitor to my MegaSTe via one of the multi-sync connection boxes available for the ST.

I've heard that some of the multi-syncs are actually "multi-scans" which are _not_ compatible. How do I know if the Crystal Scan 1024NI whizzywiget monitor I'm thinking of for the PC will work with the ST with the adaptor box gizmo?

I know I could buy an Acer multi-sync complete with the adaptor box and be assured that it will work with the STe, but the package deal I can get with the PC is quite a money saver.

Appreciate your replies by email. Thanks!

>This is the landslide the PC world is caught in.
> And now there's OS/2 which needs 8 megs
>of RAM and 32 megs of disk space and a speedy 486 to run.

Yes, and compare that to MiNT, which runs quite beautifullly in 4 megs and with very little disk space. It's true that PC software is larger than it should be. But perhaps it's because the technology has advanced so quickly, and because the new technology is so easily integratable into the existing systems. It really WASN'T hard to add VGA to your 286 machine, so it became a well-supported standard very quickly. The same applies to hard drives and RAM: IDE drives are dirt cheap now.

ST applications are generally less memory- and disk-hungry because they have to be. It takes more work to get your code small than it does to crank out anthing that works using C++. But I'm not sure it's a bad thing that applications are getting bigger. Look at the GNU stuff; do you think GCC is an inferior utility because it's nearly a megabyte binary? These days space efficiency doesn't matter much for most machines (especially ones that are easily expandable), so programmers don't have to spend as much time making their code tiny, but can instead spend that time improving the applications in more substantive ways.

Granted, this does create and endless spiral of ever-growing hardware requirements, and "another mouth to feed," as Steve put it. But it also means that (maybe) more thought can be put into application design and debugging than in "just getting it to work at all within the confines of your machine." I think most people would agree that while the 8-bit machines of yore were really nice, that doesn't mean that any ST binary that won't run in 64K is poor.

Case in point: getting a C compiler to run AT ALL on the Atari 8-bit was quite a feat, because you only had 64K to play with. On the ST we can concentrate on making a really nice compiler, and on a faster machine like a 486 or TT (or Falcon?) we can do more optimization without worrying that it'll take years to compile hello.c.

>Compilers have progressed from the orignal 37K Turbo Pascal to
>Borland C++ 3.0 which eats up half your hard disk

29 megs, fully instaled. :-)

>Microsoft C++ 7.0 which comes with 5500 pages of documentation

I nearly laughed my head off when I saw Microsoft's ad comparing Borland C++ to Microsoft C/C++, in which one of the features on the chart was "pages of documentation." Microsoft "wins" with 5500 verus the pitiful 4000 Borland supplies. :-)

From: robin@sherwood.Aus.Sun.COM
Message-ID: <1992May13.225217.5155@Aus.Sun.COM>
Source record: 222155

Since SUNOS 4.1.1 you can read and write DOS format floppies on a SPARC machine.
You can also format floppies as DOS.

Check out the manual pages on pcfs

NB - I use this all the time to transfer stuff from my ST to a SPARC system.

You will have to specify the -l switch to fdformat so as to format the floppies
as low density.

For text files you may want to check out the commands unix2dos and dos2unix.

Unfortunatly you need a program of some sort to determine that. Even in
the latest TOS atari still didn't include the TOS version number in de
'About' desktop menu.
There are several programs in A.A that will tell you the TOS version. The
only one I can call by name is sysinfo (since I wrote it). But if you want
to know it roughly:

TT's : TOS 3.05 or 3.06
Mega STE: TOS 2.05 or 2.06
1040 STE: TOS 1.6 or 2.06
ST Book: TOS 2.06 I think, maybe 2.05
Stacy: TOS 1.4
other ST: 1.0 if copyright notice is 1985,1986
1.2 if 1985,86(,87) (only in Mega ST's)
1.4 if 1985,86,87,88
2.06 if 1985,86,87,89,90,91

sourada@iastate.edu (Steven D Ourada) writes:

>I don't know if it's just my biased perception, but it does seem that
>the ST's have wonderful free software support as compared to other platforms.

Two simple reasons for this:

1. Apple spend too much time looking at and feeling up their lawyers.
(so GNU boycotts them)

2. Intel architecture looks NOTHING LIKE a workstation architectur
(ie. slab of general purpose grunt), GNU won't touch 'em.

Atari's look like baby workstations. The Sun's (before Sparc) where
mainly 680x0, with x=2, 3, or 4.

Porting to the Atari is simple. (I can think of 3 experts who would
agree, but this is my statement, not theirs).

Free software is portable software (has to be, why make it free otherwise).
In the PC-clone community, they think "portable" means that it will run
on all types of 80x8x processors. So the code is full of "far" pointers,
etc. It's a different outlook.

>out & they immediately trashed 8-bit users. I hope Atari DOESN'T come out
>with a new computer for another year so these guys will get a clone & leave
>us alone.

Man! All I did was post a message about whether I should scrap the ole ST
and get a new platform or upgrade, and I'm getting jumped all over for it.
Some users here believe that there's an US and THEM. Hey, all I want is
a good computer I can use as well as have some fun expanding and playing
around. But Rick brings back some fond memories of when I was in high
school (yes, I believe there's a couple of users that feel I'm STILL IN
high schoool...). We all used to sit around and say how so and so's computer
at home couldn't play the latest games and so it "sucked". These 8-bits
were rated on the quantity and quality of the games they churned out.

Well, I think that's the way it should be. Platforms should be rated to
what the user can get out of it for his reasonable amount of time, effort,
and of course money. Take NeXT stations for example... they're great for
a number of applications but who'd want to have one in their den or dorm
room?

Alan

>EMS and XMS are weird makeshift solutions to overcome the 640K
>border that some kretinos have created by thoughtlessly designing
>DOS. (This may be a flame, but it's the truth.)

Quite true. Keep in mind, though, that DOS was designed well before TOS was even a glimmer in Jack's eye. Back in 1982 no one worried about supporting 32 megs of RAM. So it wasn't really as idiotic as it seems now. It's just OLD.

>The hardware of modern PCs is ok, but the MSDOS and the like are
>really trash. The PC would certainly be far better off if DOS had
>been replaced by a decent OS by 1986 or so.

Hmmm. DOS (5 at least) has been perfectly reliable and bug-free as far as I've seen. I'm sure there are bugs in there, but you have to admit that TOS's track record is certainly no better. With a command line add-on like 4dos, DOS becomes quite useable. (4dos offers filename completion, aliases, and tons of other csh-like stuff. It's shareware.)

>From my experience, your claim that the broken memory management
>doesn't affect users is not true. It leads to all kinds of most
>weird problems/conflicts/symptoms when it comes to configure the
>PC, and this definitely is one reason why the PCs here cause much
>more user problems than the STs.

OK, I'll concede this point to a certain extent. Since many applications still don't fully support EMS/XMS the memory management shenanigans ARE sometimes annoying. In fact, that's my main complaint about PC's in general, which is why I listed it as one of the two main gripes in my original posting.

>You compare a 1992 state of the art PC with an ST whose hardware
>has not changed much since 1985. Try a TT.

Ah, and here is the ubiquitous counterargument which I've been expecting all along. YES, in some sense it's unfair to compare a 68000-based machine to a 80486-based machine. Quite obviously the 68000-based machine is doomed to lose out in any contest that involves sheer speed.

HOWEVER, I think it's totaly fair to compare them in the following sense: Given $1500, you go buy an Atari system, and I'll buy a PC. My PC system will have at least a 386-40, SVGA graphics (320x200x256 for animation, 1024x768x256 for stills), and a nice multisync monitor.

What will your Atari system be? A TT? I don't think $1500 will get you much past the CPU, if that.

That's the point: I'm comparing the capabilities of machines that are equivalently priced. The basic problem here is that Atari has NO VIABLE MACHINES right now. As Steve pointed out earlier, most people don't need to spend more than about US$1000 on a machine that will meet their needs. The only thing you can get for that price in the Atari line is a 68000-based machine. So in that sense it IS fair to compare a 68000-based machine with a 386 or 486 machine. (You really can buy a complete 486 system for US$1700 mail order these days. I'd never believe the prices were so low if I hadn't shopped around for several months, but trust me, they are.)

The whole point of this was not to put down Atari machines. The "my machine is better than yours" arguments really have no merit and are basically religious, in the strictest sense of the word. Would I really be so silly as to claim that the machine I've written thousands of lines of code on is a piece of junk? Obviously if it were then I wouldn't have gotten so much enjoyment out of programming it.

My only claim was that PC's aren't only for gullible people. They make a whole lot of sense for Joe and Judy Average who just want a computer to fool around with, play games, or do their taxes on.

It's a sad fact, and one that many ST users (and especially developers) are being forced to face: that money drives the market, not technological superiority. Even if the TT were $1000 total, I don't think Atari would be able to make a significant dent in PC sales because there is SO MUCH money invested in PC development now. A big big project like the IBM/Apple/Borland thing could do it, but they'll still never be able to escape the inevitable fact that there are something like 80 million PC clones out there.

Developers write for machines that allow them to feed their families. If possible, they write for machines that will help them build their companies so they can just sit around and write fun software all the time and not have to worry about doing what other people tell them to do. (Isn't that the essence of the entrepreneurial spirit -- that you don't want a boss?)

This may seem like a tangent (sorry), but my impression is that when you develop for the PC, you have a lot more income, a lot more to spend on development and debugging, a toll-free order line, a tech support staff, good documentation for your machine, well-defined standards, a more receptive user base, etc. All things which you don't get easily in the smaller Atari market.

Now I'm not saying every ST developer should drop Atari machines and head over to the PC world. The grass is always greener, I suppose. But I think I do understand why the ST has lost many many of its developers. And why there aren't many ST magazines left in the U.S.

>I think that for most standard applications there are better
>programs for the ST than for the PC, as I have just written in
>another posting. It's in the eye of the beholder whether PC or ST
>programs are "generally" better.

Like what? OK, I conceded that some really excellent ST applications
do exist, like Calamus, that have no good counterpart in the PC world.
But where is the ST equivalent of Borland C++? Or even CodeView? I'm
focusing on programmers tools because that's what I know best, but the
same thing applies to other areas as well.

>And I don't agree that the ST has a "closed architecture". It
>just has many things built in that you need a card for with a PC.
>And for many extensions, the ACSI or the mega bus are just fine
>(see above).

Well, you can't disagree with my statement that the ST is a
closed architecture. :-) It's a term that has a fairly
standard definition, which is (roughly) "can have hardware
capability added through a standardized bus mechanism." This
often involves card slots, since that's the obvious way to do it.
PC's are open, ST's are closed. Apples are open if the have
NuBus slots (or some similar mechanism), but other than that
they're closed. If Mega ST's take cards, they're open too.
I wasn't aware that they did. Most ST's, at least, don't.

In article <Bo7B22.GDF@acsu.buffalo.edu> v125rcyx@ubvmsd.cc.buffalo.edu (Die By My Hand...) writes:
> I have just started using uniterm and have a couple of questions.

Pretty good set of questions. At least, they ought to be pretty easy to answer :-).

>First,how do I save the setup so that it automatically starts up with the >program?

Hit the "Help" key. That puts you into the "desktop" system. Select the "File" menu bar. One of the items in the pull-down menu is "Save Setup". Click it. You'll get a file selector, and the file name to save is "uniterm.set". It should put you in the appropriate directory, so life should be pretty simple.

To get back to terminal emulation, you can (so long as nothing on the menus is selected) either press the left mouse button, or type "q".

>Also,it doesnt seem to support z-modem.Is there a newer version >that does?

No. You can, if you have enough memory (this could be grounds for a further query...), choose the option (again on the File menu) called "Run Program." You could then use the file selector to choose some program such as "xyzshell.prg", which runs Zmodem. This is the best you're gonna get out of Uniterm. The author is now programming Crays in Switzerland, and isn't doing any more development.

>Or is there any other good terminal program on any ftp sites >that does?
Yes, there are some. The only one that I can think of offhand is Freeze Dried Terminal, probably at umich, under some name like "fzt211.zoo" or similar.

>Is there any way to improve the speed that the screen scrolls >(other than buying a faster modem,which i need badly)?
You might check the terminal settings; if it is set to "Smooth Scrolling", the scrolling is labourously slow. (Real VT terminals are also very slow when they are set to smooth scrolling, so it's not as if Uniterm is performing badly with this.)

If it's set to "Jump Scroll", then the lack of speed is most probably due to the fact that your modem is slow. And no change of terminal software will fix that!

>Also,is there a manual for this program?
It should have been included. It's available at
atari.archive.umich.edu.

Note that there are TWO versions of the manual:
1) TeX files. Produces GORGEOUS results. Very pretty, but requires
interesting software and hardware combinations in order to print it
out. (See: CS-TeX. VERY VERY good package. I'm not just saying that
- I'm actually salivating!)

2) Ascii approximation of TeX files. Pretty ugly, but mostly
readable.

The normal distribution includes both of these. If you can't find
'em, just send mail.

Newsgroup: comp.sys.atari.st
Date: 1992-05-14 07:26:47 UTC
From: Marc_Crompton@mindlink.bc.ca
Message-ID: <11979@mindlink.bc.ca>
Source record: 222166

Thanks to all that came to my aid! My problem is solved and it was merely a question of not reorganizing my database! This was complicated by trying to run accesories that interfered with superbase's operations. Thanks again for all the help!

Cheers, Marc

PS I promise I wasn't going to change all those damn commas manually! An e-mail response suggested trying "set option - use quotations." If I'd needed to, I suspect that would have been the easiest way around the commas.

I had figured out how to format the DOS floppies, but how do you write
files to the DOS floppy?

>first?Any help would be appreciated.

> -Dave

Try gemview 1.1. It is able to display all kinds of graphics formats,
all described in the documentation. It supports GIF allright.
But better yet: allthough nothing in the manual was said about JPEG,
I tried it on some JPEG files and they all decompressed and displayed
nicely (and not that slow either on my 1040STF).
For black and white monitors it uses Floyd/Steinberg dithering and with
enough memory Halftoning. The first one especially gives good results.
The program has lots of other features too and it can be run as an DA.
Run as DA it even dithers in the background!
Try this one, it sure is a winner. It is shareware and should
be available from several ftp sites in Germany.
The documentation is english though ....

Try it,
Leon.

I have seen much talk of GEnie as a good source of free software. What is GEnie? Can I get there from here? Are we in Kansas anymore?

Also, I am interested in beggining programming for the ST. Can anyone recommend a good book on the subject or are there text files out there anywhere that could get me going?

Cheers

>and <Amiga left> tune NAV 2. <Z> works, but none of the other keys on
>the keyboard do anything. Try as hard as I can, I can't find the left
>Amiga on my Mega ST keyboard. :) Has anyone been able to tune the NAV
>radios on the Atari ST version of A320?
I can tune the NAV 1 with the <Z> and <\> keys. Either you made a mistake
in the message above or I have solved the problem for you...

I can't tune the NAV2 either for the same reason.

All in all A320 is a good program apart from a few (minor) points:
- The manual could do a better job of explaining the en-route and airport
charts (and, for that matter, why did they bind the book with airport
charts on top, instead of on the left, so that it would be a real book?
silly them).
- The scenery is not very detailed, and that is putting it mildly. Yes,
this is mainly an instrument flight simulator, and yes, it would require
some processor time to do it, but at least a hint of the cities and
mountains would help a lot.
- Half the navigational aids on the en-route charts are not in the
program. This means that when you are planning your flight you have
to look up all of them in the book to ensure that they are there.
- The learning curve is strange. To get from 'student pilot' to 'pilot'
you must be able to land without the autopilot. Once you have
mastered that (I haven't tried yet), the additional complications
(not using the altitude and TAS autopilots) are only minor.
- There is no wind. Thus, you can take off from, and land on any runway,
you don't have to take the wind into account during navigations and
fuel calculations, and you don't have to land with cross-wind.

But I *do* like the program.

>I still don't believe they brought 2 big speakers and a huge TV screen
>just to show Multi-TOS! What'd they want the speakers for?!?

>Maybe they'll show it on the last day of the fair, who knows...

>BTW, the IFABO is the biggest computer fair in Austria, with some 57000 m^2
>and over 700 companies... Atari had something like a 20x20m area there!

>Marinos Yannikos
>yannikos@vmars.tuwien.ac.at

Maybe I should also add that when I asked this Atari representative
about the rumors about the Falcon's price I heard some time ago
(which were in the range of $700) he said, smiling, that he'd "heard that too"...
He said that for the minimum configuration the price should be in this
range (without Harddisk), but he said he didn't know any details (memory
etc.)... Also, you should have seen Multi-TOS on the TT with NVDI installed!
The window updates are really fast!

Get MiNT v0.94, as this comes with the new version of BGACC.ACC, a utility which launches any TOS program in a window. You need to be running MiNT to do it, because the windows multi task with anything else that happens to be running!!!

You can then run any CLI you like as a desk accessory, and you get multitasking as well....

Many Thanks to everyone out there who replied to my article. Just for those doubting toms who think STOS is Too slow we currently have a screen refresh rate of 25 frames per second, when compiled. This figure does not look like getting 'much' slower. Uncompiled it takes 3 to 4 VBL's to update a screen. We have looked at all the ideas, and will hopefully be implementing as many as possible.

Thank you again

Chris.

Hey, don`t forget companies like Siemens(!), BMW and others using
the Atari for their developements. The only place Amigas are used
are a hand full of minor TV-stations in the US and why ?
Because Amiga has more colour. Great! So the Atari hasn`t, but it still
used a lot for DTP (19-inch screen...) with Linotype printers, etc.
So the Atari isn`t as dead as you would wish it is.

Other than that - STOPPPPP THIS FLAME WAR SHIT -
if you Amiga geeks are jealous - go fly a kite over the ocean with a pair
of cement boots.

5044. summary: setscreen / ste

Newsgroup: comp.sys.atari.st
Date: 1992-05-14 11:37:24 UTC
From: CASTAN@bonnie.physik.uni-stuttgart.de
Message-ID: <1992May14.113724.25910@news.uni-stuttgart.de>
Source record: 222175

```
Hello there,

Here's the summary of the SetScreen / STE problem.

Description:
If you call XBIOS.SetScreen with parameters you have read from XBIOS
before, then parts of the right screen skip to the left overscan area.
This can occur on all computers with STE - videohardware.
That includes both - 1040 STE and Mega STE.

It's a hardwareproblem that has nothing to do with th OS.

The reason is a bug in a series of SHIFTER-Chips.
Exceptions are the very first delivered Mega STEs.
Atari seemed to ignore this problem for a long time, but I got a Mail
that a Mega STE, bought on april 1st 1992 did't have this problem.

I bought mine at the same time and tested a Mega STE that isn't sold yet.
Both have the same buggy chip.

The result of a SetScreen - call depends on the state of the chip.
I know of no method to perform the call at a defined state.

Conclusions:
1) Programs should avoid calling SetScreen if they are allready in ST high mode
(rez=2).
2) If you buy a STE test it with the following program. There *are*
computers without this bug.

Appendix:
You can reproduce the effect with the following program:
It's easy to port it to other languages.

MODULE SetEd; (* MEGAMAX MODULA 2 *)

FROM SYSTEM IMPORT
ADDRESS;
FROM GrafBase IMPORT
GetScreen,SetScreen;
FROM Terminal IMPORT
Read,WriteString,WriteLn,WritePg;

VAR
log,phys: ADDRESS;
rez,I: INTEGER;
CH: CHAR;
```

```
BEGIN
WritePg(); (* Clear Screen *)
REPEAT
(* Hole aktuelle Bildschirmparameter: *)
(* C: logbase, physbase, getrez; causes no trouble *)
GetScreen (log,phys,rez);

(* Zur Orientierung auf dem Bildschirm: fuelle oberste Zeile mit Ziffern *)
FOR I := 0 TO 7 DO
WriteString ('0123456789');
END;
WriteLn;
Read (CH); (* Abbruch mit Spacebar *)

(* Evtl. gelesene Werte wieder setzen: *)
IF CH#' ' THEN SetScreen (log,phys,rez) END;
UNTIL CH=' '
END SetEd.
```

How to use it:
Press any key except spacebar to cause a SetScreen to be processed;
press spacebar to quit.

Gerd

5046. New u/l to Terminator:Plot172.zoo

Newsgroup: comp.sys.atari.st
Date: 1992-05-14 11:49:44 UTC
From: cordes@ac.dal.ca
Message-ID: <1992May14.084944.5734@ac.dal.ca>
Source record: 222176

New upload to Atari Archive: PLOT172.ZOO

[Since Jeff is having a little trouble keeping on top of all the new uploads since graduation (Congratulations Jeff!), thought I'd mention that this file is available in the new directory.]

This is an upgrade to PLOT168.ZOO, which has been in the applications/math directory on the terminator archive. The program is a 2D Function/Data plotter for high/medium resolution ST's. Works well on a Mega STE, but probably not on a TT (but maybe if the 24BIT program is run?). Some of its features are:

* Plots functions typed at the keyboard. Large range of function primitives to choose from, including the BesselJ function, the BesselI function, the Airy function and the Gamma function. Has a function history buffer. Very long function lines may be entered (more than 80 characters).

* Data (x-y coordinate pairs) can be entered in a simple editor or read from a file. Some data transformation and fitting capability is included.

* Multiple curves can be overlaid on the same plot. Text can also be added.

* Good quality hardcopy is possible via GDOS (GDOS drivers/fonts are not included).

* Various numerical utilities are built in, including an expression evaluator, numerical integration, finding zeros of functions (of any function entered at the keyboard) and complex roots of polynomials.

>stuff. It's shareware.)

I didn't mean the DOS shell is bad, I say the whole OS is trash.
There is not only that 640KB problem, even worse, there is that
8088 problem -- all those 386 and 486 processors end up playing
8bit under DOS. This prevents PCs from being as powerful as they
are. BTW, EMS and XMS reduce system performance too.
ST hardware upgrades can be hacky, but the "upgrades" to DOS to
enable handling of modern hardware are even more hacky. And most
importantly, there's no room left for further hacking. Therefore
I think DOS will be replaced by other operating systems (UNIX,
Mac system/finder, MultiTOS...) during the next few years and
disappear from professional use.
(Disclaimer: I don't intend to flame DOS, this is what I think is
going to happen. Although I never liked it, DOS has been ok for
people for a couple of years, but now it is so badly outdated
that it's time to replace it.)
One word about *MS*-DOS: I've heard that some "undocumented"
system calls were not documented by Microsoft for the public, but
they were documented for Microsoft's programmers and used by
them, so they had an advantage competing against other software
houses. I really detest people who use such methods and for me
this is a reason to boycott Microsoft.
At least, in this respect TOS is better

>>You compare a 1992 state of the art PC with an ST whose hardware
>>has not changed much since 1985. Try a TT.

>Ah, and here is the ubiquitous counterargument which I've been

>What will your Atari system be? A TT? I don't think $1500 will get
>you much past the CPU, if that.

>That's the point: I'm comparing the capabilities of machines that are
>equivalently priced. The basic problem here is that Atari has NO
>VIABLE MACHINES right now.

Well, it seems that Atari tries to do in the USA what Apple did
here in Germany: Overpricing their computers hoping that people
will finally believe that there must be some mysterious reason
they don't understand that justifies those high prices. Atari has
a reason to try, it worked over here...
However, I don't look at computer prices every day, but it seems
to me that one can buy a Mega STe for the same money as a 386 PC.
I'd prefer the Mega STe, no doubt, and I see little reason for
anyone not to do so unless people are forced to use some
"standard software" that is not available for the ST.
Regarding the lack of viable machines in the ST series, that
point is absolutely correct. It's the reason why people are
rumoring that excitedly about the Falcon. It's important for
Atari to get the Falcon out soon, and the Falcon 040 as soon as
possible.

>My only claim was that PC's aren't only for gullible people. They make
>a whole lot of sense for Joe and Judy Average who just want a computer
>to fool around with, play games, or do their taxes on.

It's surely ok for those folks to get a PC, but an ST is more
adequate for them, because it's far more user friendly. Judy &
Joe will certainly need more help with setting up their computer,
installing programs and troubleshooting if they have a PC. At
least, this is what my experience says.

>It's a sad fact, and one that many ST users (and especially
>developers) are being forced to face: that money drives the market,
>not technological superiority. Even if the TT were $1000 total, I
>don't think Atari would be able to make a significant dent in PC sales
>because there is SO MUCH money invested in PC development now. A big
>big project like the IBM/Apple/Borland thing could do it, but they'll

>something like 80 million PC clones out there.

> [stuff deleted]

>This may seem like a tangent (sorry), but my impression is that when
>you develop for the PC, you have a lot more income, a lot more to spend
>on development and debugging, a toll-free order line, a tech support

>staff, good documentation for your machine, well-defined standards, a
>more receptive user base, etc. All things which you don't get easily
>in the smaller Atari market.

Commercial developers experience an unusual strong competition
from noncommercieal ones, as I have already stated in a previous
posting. Therefore, developers and companies tend to drop ST
support and concentrate on other platforms. And, returning to the
statement that gave rise to this sub-thread, of course not
everyone who buys a clone is gullible, but those who sell hard-
and software really use the gullibility of their customers if
they can to persuade them into buying a PC, because they figure
correctly they will make more money of such customers that way.
At least a significant fraction of dealers acts that way over
here. The "arguments" they use would undoubtedly be qualified as
flames if posted.
The really sad thing is that there are these economic mechanisms
that favor systems with lots of needless comlications over user-
friendly ones.

>>I think that for most standard applications there are better
>>programs for the ST than for the PC, as I have just written in
>>another posting. It's in the eye of the beholder whether PC or ST
>>programs are "generally" better.

>Like what? OK, I conceded that some really excellent ST applications
>do exist, like Calamus, that have no good counterpart in the PC world.
>But where is the ST equivalent of Borland C++? Or even CodeView? I'm
>focusing on programmers tools because that's what I know best, but the
>same thing applies to other areas as well.

Well, since I never did any serious PC programming I can't
compare PC and ST in this field. I was thinking of Judy & Joe,
who might want to do word processing (Signum, That's write etc.),
DTP (Calamus), drawing (Arabesque, CrackArt), music
(NoiseTracker, MIDI software), everyday management things for
which there are lots of non-commercial programs around and so on.

>>And I don't agree that the ST has a "closed architecture". It
>>just has many things built in that you need a card for with a PC.
>>And for many extensions, the ACSI or the mega bus are just fine
>>(see above).

>Well, you can't disagree with my statement that the ST is a

>often involves card slots, since that's the obvious way to do it.
>PC's are open, ST's are closed. Apples are open if the have
>NuBus slots (or some similar mechanism), but other than that
>they're closed. If Mega ST's take cards, they're open too.
>I wasn't aware that they did. Most ST's, at least, don't.

Im no expert in hardware, so I'm not sure whether the ACSI bus meets the definition for an open system. At any rate, it offers a way for adding hardware, so the ST is may be closed, but not totally.
I know Dave didn't mean it this way, but (over)simplified statements such as "PCs are open, STs are closed" can be very misleading to people who don't have some background knowledge of system architectures.

First, NVDI is not readily avaliable in North America, or outside
Europe for that matter, as far as I know.
And, my understanding is that NVDI is neither as compatible or as
fast as Warp 9. Anybody with both of them know for sure?

A little related info: Atari UK has released 'FontGDOS', which seems to be an improved bitmap GDOS (no vector fonts). It includes drivers for HP500 inkjets and BJ10's. Three pounds per disk from the ST Club.

Sam.

>I have to agree with this wholeheartedly! I finally today got what I
>think (and hope) is the latest LZH, Questors 201m. (m? the last I heard
>was i!).

Doesn't this miss the point completely?
The first Atari LZH software (LZ1 archives) lacked compatibility and had so many compatibility problems (because of too many incompetent programmers and too many different versions) that it sometimes was hardly worth the effort to get the greater compression.
Then the next greatest commpression method comes out (LZ5) and Questor is the first (and only that I have seen) with a new LZH.
Everbody groans because now they can't de-arc some *.LZH files unless they have Questor's 2.01x. People slowly get Questor's program and can now un-arc LZ1 and LZ5 level archives. And Questor's program is compatible with PC LZH.
There is no reason that you have to get 2.01m just because it is the latest version. Each version is just small bug fixes, enhancements to make them more compatible with PC LZH and minor features added, etc.
Personally I use 2.01h. Treats me just fine. And the LZH files produced by all the 2.01x versions are compatible at the file level.
Questor has set the standard. Just as Darin Wayrynen's Arc 6.02 is standard for ARC so is Questor's 2.01x for LZH. Finally we have a solid LZH.

I for one appreciate Questor's pace of development. Don't get the latest and greatest if you don't have to. Stick with 2.01h or i.
You'll be fine.

Why limit yourself to a word processor that has a dictionary if
there is one without a dictionary that you like better. Just use an
outside dictionary like Thunder! Maybe someone should do a new one.

Personally, I think emacs is a great word processor (note: word, not
document). It doesn't have a dictionary, but many people use ispell
or webster with emacs to spell check their files.
I think that uemacs for the ST has a version of ispell too. Hmm,
gonna have to track that one down... :)

>the unix command sx (send Xmodem) and running FLASH on the ST. I get errors
>like 'sector error' and 'checksum error'.

Steve Yelvington covered it well. But I want to second the notion
that sometimes you have to uuencode a file.
If you have a telnet connection to the UNIX machine you won't be
able to do a binary download (ie. xmodem). If this is the case,
uuencode the file and then cat the file (list it to the screen) while
capturing it with a capture buffer or a download ASCII. Then
uudecode the file with UUD.TTP on the ST side or something similar.
Remember there is no error checking with this method during the
download so the possibility for errors is greater if you have a poor
connection.

[In article <11980@mindlink.bc.ca>,
Marc_Crompton@mindlink.bc.ca (Marc Crompton) writes ...]

> I have seen much talk of GEnie as a good source of free software. What is
> GEnie? Can I get there from here? Are we in Kansas anymore?

GEnie is an information network operated by General Electric (the U.S. company, not the U.K. company.) GE has a packet data network used by big businesses. GEnie takes advantage of that network to offer cheap access rates at nights and weekends. There are GE Information Services nodes in most major cities in North America.

Basic service is covered by a $4.95 monthly fee; for that you get no-extra-charge access to a huge selection of consumer-interest roundtables (writing, cooking, automotive, etc.). Computer-related areas and downloadable files bring an extra charge of $6/hour. Online multiplayer games, such as the Air Warrior flight/dogfight simulator, cost $6/hour.

The Atari roundtables on GEnie are officially sponsored by Atari Corp. and Atari personnel regularly answer questions there, as do many commercial software developers.

Since GEnie gives you a very nice free automated access program called Aladdin, you don't need to spend much time in the pay areas; Aladdin moves through them quickly and grabs all the new messages so that you can read off-line.

Here is GEnie's signup procedure. The phone number should be good anywhere in North America. I don't know how the Brits get access.

1. Set your communications software for for half duplex (local echo) at 300, 1200 or 2400 baud

2. Dial (toll free) 1-800-638-8369. Upon connection, enter HHH

3. At the U#= prompt enter XJM11718,ALADDIN and press return.

Then follow the online instructions. You'll need a credit card for billing.

> Also, I am interested in beggining programming for the ST. Can anyone
> recommend a good book on the subject or are there text files out there anywhere
> that could get me going?

Text files: The ``Pro GEM'' series of columns from Analog magazine are available for downloading from various BBSes. I think they're on atari.archive.

Books: ``C-Manship Complete'' is available for $19.95 U.S./$24.95 CDN direct from Taylor Ridge Books, Box 48, Manchester, Conn. 06040 USA. It's a reprint of Clay Walnum's tutorial columns from ST-Log magazine.

There are several other good books, mostly out of print. I like ``Atari ST Application Programming'' from Bantam, which you may occasionally see for sale here on the network. Watch for it.

My point was probably stated a little muddled. I own two clones in addition to my [ST, 800's, 1802 Super Elf <which is to old to use>]. Just because I own a clone or two, does not mean I like people trashing everything "NOT" MS DOS. The mere ability to run a piece of software or hardware does not entitle people to trash everyone else. For example: ST users that can't play a note & don't have a midi keyboard bragging about the built in midi port! It's kind'a like people bragging about, "Prince touched me as he walked by!" It's great that you have Autocad & Turbo-C, but what counts is what you do with the tools, not the tools you own. If you said it was you that used Auto cad to design the Shuttle robotic arm for example, I'd be REALLY impressed.

Source record: 222195

Arc shells really don't work on 520STs - not enough ram etc

if you have the file arc.ttp (or something) in the same directory as
the archive (thingy.arc) you want to 'de-archive' click on arc.ttp and enter:

x thingy.arc

this will extract all the files from the archive 'thingy.arc'. gettit ?

I heard from a UK Atari developer that Atari and Compugraphic had entered litigation over FSM GDOS. If that was true, it may be reasonable to speculate that either
a) Atari lost; or
b) Gave it up as a waste of time & money

Either way, it's goodbye GDOS.

It's interesting that FontGDOS, Atari's latest GDOS release, which features font cacheing, faster drivers, better driver set (including one for the Deskjet 500) but bitmapped fonts only, has been released in the UK. The ST Club will sell you a copy for 2.95 pounds.

Hi;

I just acquired an Atari 520ST that is very early vintage.
It loads TOS from disk. I wanna get TOS 1.4 ROMs for it.

Does anybody have their old 1.4 ROMs left over from an upgrade to 2.x
that they want to give away (or sell cheep) ?

I'm trying to turn a sow's ear (early el-strippo model 520ST) into a
silk purse (1meg RAM, 720K floppy).

Message-ID: <1992May14.174131.9388@unx.sas.com>
Source record: 222203

I have a Practical Solutions Video Key for sale. This allows the
use of a television or VCR with an ST that doesn't have an RF output.
I think the older one's are the only ST's with this problem.

I bought it used last year for $45 without a power supply. I recently
got an SC1224 and don't need the Video Key any more. I will sell it,
along with the power supply I use with it, for $35 _plus_shipping_.

If interested, contact me via email:

Actually try from 15 to 30 Megs of HD space depending on your configuration.
And it does not need a 486 to be fast, a general 386-25 does quite fast,
even the SX20 well do it fine (though given that there at least 5 megs of
RAM not 8 is required (OS/2 is weird, it needs above 4 megs to be fast)).

pictures

As far as I know, there are no good colour GIF-viewers for the ST
(like cshow for the PC), but there are Mgif37 for mono-monitors, and
I must say I'm impressed by the quality that this program shows GIF's.

The program uses a flicker routine, as far as I know, and some time ago,
there was
a discussion on the same theme, then somebody said it would be easy to
use the same
technique to get good pictures on a colour monitor. Ie. flicker the
screen to
simulate more colours and 'between' colours. There have been no posting
of such
a program though.......

(Maybe it isn't that easy ?).
But I would like a ST implementation of cshow, I mainly uses Xv though,
but
it would be a nice showoff at home .....

Any further comments on the thang.

Jarle.

> Does anyone know how to tell the computer to drop the DTR so that the
> modem drops the connection? This is a small feature of the new version
> of my terminal program, but it is an important one. Just about
> everything else has been re-worked in it. Anyway, any help on this would
> be appreciated.

```
#include <osbind.h>

void dtr(on)
int on;
{
if(on)
Offgibit(0xEF); /* DTR on */
else
Ongibit(0x10); /* DTR off */
}
```

To hang up, drop DTR for one second, then restore it and check for
carrier. (Try again if the modem is recalcitrant.) Please don't leave DTR
low; that can interfere with other programs that may want to use the aux
port later.

How true! My brother-in-law thought he was getting an inexpensive
work station when he bought his 386 clone. After compiling and
running his code, all he got was an insufficient memory error
message. So he goes back to the store and buys more RAM (it wasn't
as cheap back then as it is now), installs it, runs his code, and
alas once again insufficient memory! Did my brother-in-law (like
most 1st time computer buyers) know about DOSs 640k memory limit?
NO. Did the salesman bother to tell him about it? NO. After explaining
his problem to the salesman was the salesman willing to sell him
more RAM despite this wouldn't solve his problem. YES.

Every PC owner I've known seems to NEED to replace his/her system
about every 2-3 years. PCs are definitely money pits.

>

If you have Wordflair II, you can get FSM-GDOS by sending $US35 to Goldleaf. I did that back in January, and am very happy with it (one HELL of an improvement over the old GDOS!). The only problem is that it sometimes screws up under TOS 3.01 (there is an alert in the install programme telling me to upgradde to 3.05 or higher, which I'll do just as soon as my local dealer can get it from the distributor).

Why in the world would Atari drop such a system? The resulting printer output on my Laserjet IIIP is just amazing, and the death of bitmap fonts couldn't have come soon enough (I can use any point size I want, and add new ones without rebooting!). I don't know if this `dropping' rumour is true, but it doesn't make any sense to me.

Use a program that can intelligently "Dither" to 16 colors. Some programs do this better than others, the best I've found is Adobe Photoshop on the Mac (Spectre!). These programs can produce some extremely nice results. I've had some really nice GIFs look about 90% as good as the original, others don't look good without a lot of experimenting with the contrast and brightness (with the photo-touchup software, not your monitor knobs! sheesh! :-)

Really, some of these look fantastic...

Source record: 222245

I have recently been doing backups of my partitions. The %ages that LH201h gives are how much of the origanal size that they now are. To tell the truth I find that these figures can be a little bit out but the files (only a single file for each drive by the way) are definatly smaller than the drive contents itself. When I compress I us 'm /r drive.lzh *.*' if that is any help as this compresses everything into a single file and also keeps the directory paths (ie when you de-compress the file the directories get created as well.) Now all I need is a way of getting >720K files onto a floppy :-(

David Ford	To err is human but to really cock it up takes

Here's the current state of FSM/GDOS in the US right now:

- You can get it with WordFlair II
- A lot of the newer cool programs are being constructed with FSM/GDOS support built-in, such as DTP, drawing, etc.
- It is not yet available for the public to buy as a standalone package

So, to sum up, it DOES exist, it DOES work, and it most definitely is 1000 times better than GDOS (just ask anyone with Wordflair II), so if you really have to have it now call Goldleaf. Atari really has two options IMHO:
1) They can release it to the public as an add-on to current TOS, and make it part of MultiTOS when it is released
2) They can do like GDOS and you get it when you buy a program that uses it (like Wordflair II)

I think option #1 would be cooler because then we might end up with more FSM/GDOS supporting programs, but perhaps it is a distribution/ licensing problem? Anyway you can get a fully operational and amazing copy

of FSM/GDOS with current programs on the market.

May be they are closing Shop like they are doing here and in OZZ, I don't think they will be here much longer..

Customers have just about had enough of Ataries FOG WARE or should I say SMOG WARE...

Atari OZZ has a for Sale sign out side, and from what I found out today, there is no more support for New Zealand at all...

This is some dealings I have just had in the last 4/5 weeks with Atari OZZ..

It has taken me sum 12 Toll calls to get some faulty DMA chips replaced, each time I was told they would ring me back, they never did, they even tried to ring me collect, I was also told I would get the chips in 3 days, that 3 days ended up to be 15 days, this was by a manager......

And each time I had to explain the same thing over again, even to the same manager...

The first time I rang was on the 8 th April, I finaly got the free DMA chips on the 14th May..

Is this customer support, you can say what you like about Atari, but for ME its DEAD...

Roger.... sheppard_r@kosmos.wcc.govt.nz

Had your ST for 5 years, huh? I'd say it is time to retire it
for a MEGASTE..... My original ST is under my waterbed.....

Ziggy.

BTW, this was not intended to induce flaming.......

[signature deleted]

I'd love to express myself in the same 'mature' way as Dave and the few that writes as good as he does. However, English isn't my native language, and the same goes for LOTS of other guys that use Usenet. It isn't always easy to express your feelings and/or opinions in a language which you don't normally speak. Note: I'm NOT complaining! I just want everyone with English as 'their' language to understand that there are people out there that tries REALLY hard to write in a so called 'mature' way. Unfortunately words gets mixed up and every-day expressions are misused. Many wars have started just because people have misunderstood each other, one way or another. Even persons with the same native language can misunderstand each other totally. It's also possible to 'stretch' the language. Especially the written word is subject to many 'stretches'. Just look at the all-mighty LAW. How many criminals hasn't escaped punishment just because some wiz-word-stretcher has managed to 're-evaluate' the law.

The latest example of misunderstanding or word-stretching that I can come up with is the trial against Rodney King. The reason to why the police-men were found "not guilty" (as said in the Swedish news-papers and TV at least) was the fact that the defence had managed to convince the jury that the police-men had acted according to regulations (to keep the arrested man still). I just wonder how far the law can be stretched or 're-evaluated'! Note: This is my very PERSONAL opinion after seeing both the original video and the commented video (where someone explains why the police-men are bashing the shit out of a defensless man). I'm living in a country where police-brutality is an almost forgotten word (lucky me). When I first saw the Rodney King-video I was quite chocked. I didn't think anything like that existed. On the other hand, most americans would be quite shocked if they turned on the TV one late night and found an xxx-rated porno film on one of the cable channels. I don't find THAT very shocking. I also think many americans would be a bit chocked if women would start sun-bathing topless on the beaches. Note: I'm NOT flaming the americans, I'm just pointing out some of the MANY differances between different parts of the world!

If you don't know the language very well you are probably also
affraid of using 'mature' words (long and hard to spell). At least
that's how I feel. If I don't know how THAT word is spelled I usually
tries to rewrite the sentence with simpler words instead of looking
up the word in the dictionary (I'm a lazy bastard you know). A thing
that is even more common is _AWFUL_ grammar. I'm sure this short
article would upset an english-teacher quite much. The worst thing
is that it's hard to look it up in a book. You need basic knowledge
of the language to be able to use correct grammar. Most people do
know some of the basic things about English, but when it comes to
'mature' articles you need more than that.

Flames are cheerfully ignored!!!

Constructive criticism and flames are not related at all! :-)

Thanks for your time!

>you're gonna get out of Uniterm.
You can program a function key to run xyz... or whatever rz/sz program you want to run - again, only if you have enough memory. You need to set the value of the system buffer to leave enough room to run the sz/rz or whatever program. This is done via one of the menus.
You can also program the pop-up menu (right mouse click) to run them.
IMPORTANT: get the manual, and all the associated files, from a.a.

5091. Weak chips in the Mega ST

Newsgroup: comp.sys.atari.st
Date: 1992-05-15 01:23:38 UTC
From: dtarico@misvax.mis.arizona.edu
Message-ID: <1992May14.182338.1@misvax.mis.arizona.edu>
Source record: 222228
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Just a note to any of you Mega ST owners out there. I tried to install a PC-Ditto II and later an AT-Speed into my Mega 2 ST. Neither worked properly and both crashed very frequently. After much time trying to find out what the problem was (both of the add-ons worked fine on my 1040 ST), I finally heard rumor about some of the Mega ST's having some weak chips. A friend of mine asked about it up on Compuserve, and I finally got the details about the problem. Some of the Mega ST's had weak 74LS373 chips on the motherboard. This was know to cause problems with the ST, such as crashing and bombs, or glitches on the screen. They also could cause trouble when trying to use add-on hardware. If your chips have SGS or SG stamped on them, then they are suspect. I just went down to my local electronics store, spent $1.20 each for two new 74LS373 chips, removed the old chips and installed the new ones (this does involve soldering). My AT-Speed is now up and hapilly running (actually, it is running, and -I- am happy).

I just wanted to spread the word about this problem, as I had never heard about it before. Adios.

Yeah, but it does compress to the tune of a 30% savings... It reports such
as it works and shows such in it's verbose listing. The older versions
of lharc report similar compression... but the filesize doesn't bloat.

Message-ID: <1992May15.052806.12416@CS.ORST.EDU>
Source record: 222230

Recently, my money supply got -very- tight and I had to sell my Syquest hard drive to cover the bills. Well, without a hard drive, my copy of Wordflair II is essentially useless.

So I offer it to anybody who will make me a good enough deal. I will not take a bath on this, so I reserve the right to refuse any offer. I plan on getting another hard disk in a couple of months, so if I have to, I'll just hang on to it until then.

This is a great opportunity for you to get the new FSM-GDOS, which is real nice. It produces -outstanding- output, even from my cheesy 9-pin printer.

>seriously screwed up. Looks to me like block size, but I may
>be wrong. I feel sure one of you guys can sort it immediately,
>or point me at a FAQ with the answer.
>

I have had the same problems, and followed the previous thread closely to see
if that issue would be brought up, but it wasn't. Here is my experience.

What you assume is correct. The sparc is either messing up, or not changing
the second FAT table. What I did is run it through some programs I have called
SENTRY and the other is DLII024. It took a few runs through both programs to
clear up the problem, but out of 10 disks, I had only 1 or 2 that did not
recover and remained garbled. I was transferring .ARC files and all but the
two disks had the files de-arc successfully.

If someone has a better solution to this, please let us know 'cuz my method is
a pain in the butt.

Having a computer which will display SuperVGA resolution does *NOT* mean that you will automatically HAVE to buy a monitor which will display those modes... any more than the ST being able to display hi-resolution graphics meant that you HAD to use anything other than a cheapo TV set...

It DOES mean that when you're ready to move up to those kinds of standards, your computer will be CAPABLE of moving up with you...

5100. Mint 0.94 and accessory problems

Newsgroup: comp.sys.atari.st
Date: 1992-05-15 08:07:33 UTC
From: mfg@gmdzi.gmd.de
Message-ID: <1992May15.080733.2678@gmdzi.gmd.de>
Source record: 222233

To get the benefits of the windowing of bg.acc I installed Mint 0.92 (upgrade from 0.91). Now I got trouble with two accessories that worked with 0.91 without any problems: Chameleon.acc (v19) and Clipboard.acc (I think both are distributed with Gemini 2.0)

The first one, Chameleon.acc, that allows for loading and unloadind ACCs dynamically, makes Mint exiting during gem-bootup. I think this is due to the changed Superexec() handling of Mint 0.94 compared to the old 0.91. (as far as I understand the traces).

The second one, Clipboard.acc, simply does not find its RSC file if there is any environment variable defined (???) (as its now possible in mint.cnf). If I enable Mints tracing, the bootstrap works (??????) So it might be a timing problem as well. This is sad, because this ACC is able to display nearly every files contents in a GEM-Window on the desctop on the one hand and on the other hand the predefined environment is very useful if you start TTPs with bg.acc.

Unfortunately I have no sources of both ACCs. If anybody out there knows how to fix, circumvent, or hide these problems, please tell me.

By the way, I know, that it is not up to the developers of such wonderful (and free!!) software like mint (thanks Eric!) to deal with minor compatibility problems of this kind. But the problems are worth mentioning, because both ACCs claim to be "clean TOS+GEM" programs, not using any undocumented features.

Thanks,

Martin F. Gergeleit <mfg@gmdzi.gmd.de>

>misleading to people who don't have some background knowledge of
>system architectures.

STs are "closed" by definition... there is NO way provided to
expand them.

PCs are "open" by definition... there are "slots" into which ANY
of a myriad of expansion boards can be inserted.

STs can ONLY be "expanded" by hacking, slashing and unsoldering
circuits within their cases, and PRAYing that the resulting
mess will stay working for a while.

PCs can be expanded by simply plugging in a new board.

STs are as closed as closed can be... as Atari intended them to be.

You can enter the name in one of the configuration dialogs.

>Also,it doesnt seem to support z-modem.Is there a newer version
>that does?

Get the gszrz package from atari.archive. Create two scripts, one for sending
with zmodem and one for receiving:
* Sending: - select a file using file selector (or whatever)
- issue the command to put the host in receive mode
(i.e. send "rz")
- execute sz.prg with the selected file(s) as arguments.
* Receiving: - change to a convenient directory
- ask about the files to receive
- shout 'sz <files_to_get>' to the other side
- execute rz.prg
I have scripts that do this (and more). They even might be at atari.archive.

>Or is there any other good terminal program on any ftp sites

>hello world. in my quest for a 68030 assembler, i've been informed that
>TurboAss is a nice shareware package. where can i find it? could some

The TurboAss does not support 68030 ops and -adressing modes. Furthermore, it runs very, very badly on the TT whith the Debugger crashing continuously.

Its programmers dropped the Atari-support, so there's no hope that it'll be available for the 030 any time. TurboAss was indeed nice for the ST, but on the TT it's quite useless, for neither the assembler nor the debugger run stabile.

I'd use the EasyRider-assembler or MASM that comes with the Turbo C / Pure C packages.

>I am surprised this has not been challenged. I thought that the reason
>the Atari monitors were flicker free was that they were 70Hz. Can someone
>clarify, please?

The ST line has 3 resolutions for 2 types of monitors: High Rez is refreshed at
72 Hz, medium and low rez at 50 or 60 Hz (software selectable).
The flicker-freeness applies therefore to the monochrome screens only.

I've always used DigiSpec to view GIFs. It's from the same guys who did Spectrum 512 and Unispec. It displays the GIFs in Spectrum format, which pretty accurately diplays the colors, since it can display 512 colors, and most GIFs are 256. It will display just about every GIF I've ever tried (the only ones that didn't display were in some weird non-standard IBM GIF format). You can do GIFs larger than 320x200, it scales the picture down to ST low. This works well, the only problem is if there's some text in the GIF, is becomes a little hard to read. Back to the subject of color, DigiSpec uses dithering routines to give the ST a 'virtual palette' of around 32,000 colors. All in all it's a very good program for GIF viewing, but unfortunately doesn't support the new JPEG format. Oh well, can't ask for everything!

I have also had problems reading files which I transferred from a SUN (via MCOPY) to a PC disk. My problem wasn`t garbled data, but rather truncated files. Anything over about 200K seemed to get chopped off when I transferred (copied) it to the hard drive on my atari. I somewhat accidentally found that if I used a fast file copier called CHEETAH everything
would be copied correctly to my atari.
I don`t know _why_ this is so, but it works for me!! Maybe other copiers will also work, but I`ve never tried to find out.

Daniel,

Due to your stated lack of understanding of the English language (which
you manage very well, by the way), perhaps you misunderstood _my_ intent.
Whether proficient in English or not, when someone enters a message like:

"ATARI SUCKS" <-- (or enter any flame-brand-of-the-week)

I automatically classify them as either stupid, immature, or just plain jerks
who I wouldn't trust to water my cactus garden! You don't have to be an
English language professor to be polite... common courtesy doesn't cost a
thing on the net and it constantly amazes me to see people make themselves
appear to be total "flaming" idiots by their lack of respect for others. So
when I ask people to be "mature", I'm not at all concerned with their grammar
style or spelling or what have you. Hope you understand _my_ intent now.

Yes, it is difficult to express intent when conversing by the typewritten
word. That's why smilely faces :) ;-) were created... to try to humanize
the medium a little. It doesn't always work. :(

So... "immature" == stupid comments, _not_ grammatical correctness. OK?

Thanks,

I guess what your saying is that Elvis does and STevie doesn't?
When I first got hold of STevie, I thought it was fine, but then I got hold of Elvis and haven't used STevie since! I have been using vi daily for many years and it's really nice to have it on the ST. It's just easier than learning new habits.

One thing that bothers me is this: If I have Elvis installed on my NeoDesk Desktop, or create a macro calling Elvis, the path always switches to the application path when I start up Elvis. Now when I create a new file, I have to state the pathname explicitly, or my file goes into the Elvis directory. Can anyone suggest a way to cause the system to stay in the path of the argument? This of course also happens when I start up a CLI. What I would prefer is that when I hit the Elvis or CLI hotkey or desktop icon, the path would remain at the top window path.

5116. ZModem, 7 bit connections

Newsgroup: comp.sys.atari.st

Source record: 222240

Burning question:

Which Atari Zmodem packages support the 7 bit option? I do a lot of communicating with a Sun workstation thru a Sytek network that only handles 7 bits worth of communications. sz/rz is available on the Sun, and it knows about the translation required to get binaries transferred over 7 bit lines, but I haven't been able to get anything running on the Atari side.

I've been using Kermit all along, which certainly works, but is pretty slow, and doesn't know about crash recovery. Has anybody been using Z

(*)--
(*)
(*)I had figured out how to format the DOS floppies, but how do you write
(*)files to the DOS floppy?

Format the disks using 'fdformat -L -d /dev/device_name(probably /dev/rfd0)'
Then as a super-user, do 'mount /pcfs'.
The sparc can then see the disk as if it is the file /pcfs.
Copy files to disk as if it was a normal file using 'cp'.

hutch@bellman.lanl.gov (John Hutchinson) writes:
[stuff deleted]
: Due to your stated lack of understanding of the English language (which
: you manage very well, by the way), perhaps you misunderstood _my_ intent.

No, I understood you! I just tried to explain that it's possible
to be classified as immature even though your intention wasn't
to flame someone in the first place.

: Whether proficient in English or not, when someone enters a message like:
:
: "ATARI SUCKS" <-- (or enter any flame-brand-of-the-week)
:
: I automatically classify them as either stupid, immature, or just plain jerks
: who I wouldn't trust to water my cactus garden!

Of course! But it's not always the flame is as clear as in your
example. The wrong choice of words can be enough to start a
(flame)war. It's also possible to stretch the meaning of the
words to suit YOUR sake (as I tried to point out in my article
(sorry for using such a controversial(sp?) subject as I did)).

: You don't have to be an
: English language professor to be polite... common courtesy doesn't cost a
: thing on the net and it constantly amazes me to see people make themselves
: appear to be total "flaming" idiots by their lack of respect for others.

One must understand that the medium we are talking about is
very new to mankind. To write normal letters is a completely
different thing since it takes much longer to reach the
destination. That makes you think twice on what you write.
Todays fast communication often also makes you write letters
faster, and you spend less time thinking of what you want to
say and how you say it.

: So
: when I ask people to be "mature", I'm not at all concerned with their grammar
: style or spelling or what have you.

: Hope you understand _my_ intent now.

And I hope you understand _my_ intent. ;-)

: Yes, it is difficult to express intent when conversing by the typewritten
: word. That's why smilely faces :) ;-) were created... to try to humanize
: the medium a little. It doesn't always work. :(

The world is full of misunderstandings! :^(

: So... "immature" == stupid comments, _not_ grammatical correctness. OK?

Yes! Just remember that an obvious flame doesn't always need
to be what it looks like (even though a flame often is just
what it looks like ;-).

Today I saw pictures of Atari Falcon on the cover of a german magazine.
It looked like a 1040 but in darker grey. The text on the keys was written
in yellow. The article mostly said the usual things. I remember that
the graphics would be 800x600 in 256 colours or 640x480 in 65536 colours.
Let's hope it's not just more rumours...

I reckon Daniel expresses himself in English better than many native English
speakers. It is we who are "lazy bastards" when it comes to learning other
languages, or trying to understand other cultures.
Same goes for computer people - we don't bother to find out the good things
about other machines and their "cultures", so we flame instead.

I always use the mtools package that's installed on our Sparc systems.
These are a set of msdos-tools that let you perform several functions.
You should take care that you format your disks on your ST.

Bart-Jan.

>You can also format floppies as DOS.
>Check out the manual pages on pcfs
sure, but pcfs requires mounting the disk drive after inserting the disk.
And only "root" is allowed to do so (no problem for me, I do have root
privileges ;-) thus excluding the normal user from this solution. The mtools
are the better way. The only problem with them is that there is no comfortable
way to dump a whole directory tree onto disc, you've got to do it all alone.

>For text files you may want to check out the commands unix2dos and dos2unix.
No need for unix2dos and dos2unix, since both mread and write have a -t switch
for text files.

How many files are we talking about here? Dozens? Hundreds?

Are you storing full pathnames? If so, add the space it takes for the full pathname on each file (prolly 128 bytes). How about comments? I've noticed Questor lzh puts a commentof 'Atari' on every file sometimes, I always figured it's because ARCSHELL is so braindead it passes a bogus option to lharc or something. (I really hate arcshell, I wish I could either learn to live without it or just write one that really works. The current one is a Prime Example of How Not to Write Programs.)

Anyway, if you figure an overhead of a few hundred bytes per file on hundreds of files, that would explain things.

>clarify, please?

The ST color resolution refresh at 60hz generally, and can be switched
to 50hz in software. Only monochrome mode refreshes at 70hz.

On the PC side, you find refresh rates from 56hz up to 72hz, with the
lower refresh rates being used on the higher dimensional resolutions
(eg, 800x600, 1024x768) on the cheaper video cards.

> clipboard.acc can't find its resource file if any environment variables
> are defined

It isn't documented anywhere (that I know of), but GEM uses the PATH=
variable to search for RSC files. It looks first in the current dir,
and if it doesn't find the RSC file there it looks in any paths listed
in PATH=.

When I wrote GEMENV, I had some TOS 1.0 users complain that GEM couldn't
find RSC files, and it turned out to be brain damage in TOS 1.0. It
wanted to see old-style env vars that look like PATH=\0c:\whatever\0,
ie, with a nullterm char between the '=' and the start of the value.
So, I had to add an option to GEMENV to let it store the env data in
that format to keep GEM happy.

Generally, you can put a missing RSC file in the root dir of the boot
disk, and GEM will always find it there. Of course, no telling what
other resident software may be doing to defeat that.

>
>STs are as closed as closed can be... as Atari intended them to be.
>

When our dept got ethernet, all the PC owners rushed out to get
ethernet boards and "simply plugged them in". After about a year of
gnashing of teeth, discussing little else in the coffee room,
comparing various incompatible software drivers, they finally started
getting some of them to work. Meanwhile one of the Mac (Classic) users
bought a SCSI-ethernet board, and was FTPing, receiving mail etc
almost immediately. Of course, I still can't link my ST to ethernet
for less than 1k$ but that is not because it is closed (cheap
ACSI-SCSI-ethernet hardware exists), it is because of the lack of
software drivers, which is another story.

I am aware of the advantages of a completely open architecture
especially in a laboratory setting, but I thought BR's statements were
a bit extreme.

The early Mac demonstrates the advantages of a closed architecture;
installation and use of software is extremely standard. Installation
rarely involves more than dragging an icon from floppy to the hard
disk. Meanwhile installation of a new version of WordPerfect on a DOS
system (from what I hear in the hallways) is not unlike a visit to the
dentist.

Somehow the ST has managed to get neither the advantages of an open
system or the simplicity of standard software implentations. The 2
main DTP programs have their own font file systems and neither is the
Atari standard (I gather there are several others as well).

Installation of FSM GDOS is reasonably straight forward, but it's a long way from from the simplicity of installing Adobe Type Manager, which has a similar function for Macs.

We keep buying more Ataris though, 'cause they're easy to program (and I'm too lazy to port my code), and they run commercial Mac software with an expansion board that requires no hacking, slashing, unsoldering or prayer.

Werner

That's odd -- the new Supexec should be *more* compatible :-(. I'll try to figure out what might be happening.

> The second one, Clipboard.acc, simply does not find its RSC file if there is any
> environment variable defined (???) (as its now possible in mint.cnf).

Make sure you include your boot disk in a PATH variable, e.g.:

setenv PATH C:;C:\BIN;C:\GNU\BIN

(',' may be used as a path separator instead of ';' if you have TOS 2.X or TOS 3.X). I think the problem is that the AES is looking along PATH for the .RSC file. (I don't understand why timing would affect this, though, unless the AES also sets up a default path sometime after loading .ACC files).

> By the way, I know, that it is not up to the developers of such wonderful

> problems of this kind.

Thanks for the kind words. In fact if MiNT is being incompatible I do want to know about it. (I can't guarantee that I can fix it, of course, but that's another matter!)

Isnt this the reason that one buys such a computer? I know it is for me! Whats the fun on a PC, where _everything_ has been done? Wheres the challenge? The sense of adventure!

Of course, I also use my ST for MIDI, which is yet another good reason for the ST. Why buy a $1000 PC, _and_ have to buy a MIDI card to boot, when one can set up a ST MIDI system for ~$500? Yes, this is a narrow viewpoint. But, MIDI is the Atari niche (for now at least)

Hello fellow 8-bitters. I just came into posession of some Atari 800XL and 600XL machines after only having an Atari 800. I want to run them from a battery and I have no idea what the current specifications are for the XL supply. I can figure out the voltages OK with a voltmeter, but I also need to know how much juice the thing wants to draw. I have no manuals for these puppies or I'd look this up myself. Would someone out there in net-land who is knowedgable about these matters please respond via e-mail and tell me how much current each of the supply rails is expected to source?

Thank you!

Tuning of the NAV aids is done from the mouse and that little box on the left of the screen. To alter the radial you need \ and z for one of them and INSERT and CLR HOME for the other. BTW do not try to put and ILS figure into NAV 2, it will not work.

Who else has tried asymetrical landings BTW ? (Not that I'm bragging or anything) :-)

PS Has anyone worked out how to add fuel from the pre takeoff stage ?

David Ford	To err is human but to really cock it up takes
dford@cix.compulink.uk	a computer operator.

>file) and Hermes will do all the rest for you.
>E.g., I have set LOGNAME to "wr" and FULLNAME to "Wolfram Roesler",
>see this msg's header for the results...

Where / what is the env vars LOGNAME etc???

I'm using... no, make that trying to use, Hermes (with a very patient
sysop :-).
I use the GUS interface to use hermes (which is very nice and helpful
as i'm pulling in 2 megs of news a day and somehow don't quite get time
to read it all so a quick look at the subjects is good)

Anyway, my problems are a. No english manual (some of the files are, but
only a few), anyone know where I can get some, especially for the UUWORK
program, I can't get that to poll apart from forcing a poll
(i.e. launching it with a sitename "uuwork equinox")

and the big problem is that I keep on sending data in the X packets in my
outgoing mail ?!
This means it screws up the UUCP site that i'm running off & the sysop there
has to manually reconstruct my mail to go out, which I don't think he's
very happy about at all.

What could be causing this?

Thanks,
Craig.

Or, instead of that, change the field seperator (under OPTIONS I think -
whatever is on the right hand side of the menu bar.)
I have changed mine to | so I can export data that has commas in it so
it can be imported into a custom written program on an IBM BBS.
A comma is really the stupidist thing that they could have it defaulting to!!
It must be one of the most common used non-alphabet characters used in data.

Hello Jeff,

>Does anyone know which C compilers there are for the ST/TT that produce
>code that takes advantage of a 68881/2 coprocessor (if present)?
Pure C by Application Systems Heidelberg (germany)

Pure C is a update from Turbo C because Borleand support the Atari Software
not longer here in germany. I don't know if there are any distributors in
other countrys.

Pure C includes a Editor, Compiler, Assembler, Linker and a realy good
Debugger three Disks and three documentation (one for the Compiler, one for
the Assembler and one for the Debugger).

There are Compileroptions for the coprozessor MC68881 and the MC68882 too.
The Assembler can create opcode for:
MC 68000, MC68010, MC68020, MC68030, MC68040,
MC 68851, MC68881 and the MC68882

However, since several people want the MIDI info specifically,
here it is:

Q: Where can I find out all about MIDI?

A:

Email LISTSERV@AUVM.AMERICAN.EDU, with the phrase GET MIDISPEC
PACKAGE in the message body. You will get the following message, as
well as the files to which it refers.

Date: Tue, 26 Nov 1991 18:32:49 -0500
From: Revised List Processor (1.7a) <LISTSERV@AUVM.AMERICAN.EDU>
Subject: File: "MIDISPEC $PACKAGE" being sent to you

```
*************************************************************************
* *
* MIDISPEC Package *
* *
* The following series of plain text files are the contents of the *
* MIDISPEC PACKAGE. They are a reference resource compiled from several *
* sources, mostly by Greg at LEE@UHCCUX. The Primer, originally written *
* by Bob McQueer, is in constant revision. The other files are subject *
* to periodic review and update. The package as a whole may be added to *
* as MIDI expands. *
* *
```

```
* They have been placed here to make it possible for users to retrieve *
* or subscribe to the whole set of documents as a "package" so as to *
* automatically get the updated documentation when it is made *
* available. Access to the complete package is possible via GET *
* MIDISPEC PACKAGE. *
* *
* You can subscribe to it with: AFD ADD MIDISPEC PACKAGE (note that you *
* will need to use the PW command to define yourself a password before *
* you can use the AFD command -- see LISTAFD MEMO for more details). *
* If you wish to only be informed when the files are updated, use the *
* FUI ADD MIDISPEC PACKAGE command. *
* *
**************************************************************************

5148. gcc2.1 & time.h

Newsgroup: comp.sys.atari.st
Date: 1992-05-16 15:46:24 UTC
From: paulb@world.std.com
Message-ID: <BoCp5D.Es6@world.std.com>
Source record: 222125

Hi all!

I'm trying to use the functions in time.h of gcc2.1.
They all (seem to) return NULLS whenever I call them. I'm using patch
level 79. Does anyone know if these were not coded, and if not when they
might be? The ST SHOULD be able to return valid times...
Or is it something I'm doing wrong?

-paulb
(paulb@world.std.com) Thank you! :-)

5149. Re: g++ test 'tstring.cc' fails on input. Any hints?

> cin. I got a buserror there.
>

sorry my fault, i forgot to increase its _stksize. you can do this with
fixstk 16k tstring.ttp
or you can add the following line at the top of tstring.cc
extern "C" long _stksize = 16*1024;

cheers,

5150. Re: Atari's STILL here?!?

Newsgroup: comp.sys.atari.st
Date: 1992-05-16 16:16:33 UTC
From: plate@cdsmn.mn.org
Message-ID: <1992May16.161633.7243@cdsmn.mn.org>
Source record: 222149

I never thought I'd join in a discussion such as this, but here I am.
The reason I say that is because I think the computer wars are silly.
Please view apparently stupid comments as attempted humor.

The main problem is that people don't factor in price/performance. If
you have unlimited money to spend, by all means spend it on the fastest,
best computer available. Then let your kids play PAC-MAN very, very, very
very, extremely very fast!

If you've got 500 bucks buy an ST! Then your kids can just play PAC-MAN at
normal speed though (Sorry, shoulda bought that CRAY).

All I know is that I sold my Apple IIe to pay for my ST. The Apple IIe is
priced the same as Atari (used) if not a little higher in some cases. I used
the IIe for many years. IMHO (I must have onions) I got the better end of the
deal because I got the ST, a better computer than the IIe. I would hazard to
say, that the ST is functionally equivilent to an Apple IIGS that carries a
used price of $800-1200. I would say that the ST is better than a MAC 512
that is priced (again, used) about the same as an ST. I can easily say that
a $500 dollar ST will beat the pants off of a $500 dollar used PC, for
usability and speed. I keep saying used, but even comparing a brand new
1040ST to a PC OF THE SAME PRICE, the ST gets my vote.

But ST CANNOT touch the performance of a 486dx, 16Mbytes RAM, 1.6Gbyte
fast SCSI hard disk with EISA/SCSI Controller (4Mbytes onboard cache), 32 bit
Truevision Vista Graphics card, 19 inch RGB Monitor, High Resolution digitizing
tablet, Quad DSP multiprocessing accelerator, and GPIB interface adapter.
Well, yeah, the 32 Graphics cards alone does cost as much as my entire ST,
but hey....this still means the ST must be a piece of crap right?

So many people (especially the computer smart people on usenet and it's
various branches) look at their computers like sports cars, saying "mine
is faster! Mine is better!". Your Jaguar will definitely out run my
`74 Dodge van (so will your VW beetle for that matter!) But I don't care!
My Dodge van is payed for, it gets me to work every day (even on sub-zero
Minnesota days), and I can even haul band equipment in it, & grudgingly help
relatives move furniture! My $500 STe does exactly what I need it to do,
plus it plays stereo music, displays color graphics and plays cool games
like "Escape From the Planet of the Robot Monsters" so I can impress my
friends (so my friends are easily impressed) and entertain my children.

If your ST is payed for, and you have software for it, then use it. Buy
a PC, a Mac, an Amiga, an Acorn, a CoCoII, an AppleII, a Commodore128,
a MicroVax, a Sun SparcStation, an Iris Indigo, a Next and a Timex ZX81,
place them all in your den and play PAC-MAN on all of them simultaneously!
I know, I'm being silly, but hey, they're just MACHINES!!

Doug
p.s. That 486dx system I described is real, and I work with them daily.
If I could, I would certainly have one. Unfortunately, I would have to
sell my house. "Hey buddy, got a quarter so I can buy some floppy disks?"

In <1992May13.113224.19941@urz.unibas.ch>, Capt.J.T. Kirk writes:
>I don't know that much about it, but I can sure say it's good.
>I read a few things in an article of the 'ST-Computer' (a german mag)
>and with the use of especially C it is supposed to be great (also
>with Pascal, if I remember correctly).
personally I wouldn't count a good article on ACS in the "ST-Computer"
as a good reference for this, for Maxon (ACS) and Heim (ST-Computer)
are closely related to each other, Maxon products always get good
reviews in the "ST-Computer" mag.... ;-(
A friend of mine told me it should have some strange bugs and generate
HUGE executables (A hello-World in a GEM Window + a few *small*
goodies added gave an executable of ~100KB).
Also it only contains works with Turbo-C/Pure-C yet.

yours,

Benedikt

MultiTOS

MultiTOS is developed partly by ATARI Corp. and they included
the multitasking kernel MiNT, which they have licensed from:
Eric R. Smith
Dept. of Mathematics
University of Western Ontario
London, Ontario, Canada N6A 5B7
Email: eric.smith@uwo.ca
MultiTOS doesn't fit in the standard ST TOS-ROMs, therefore
a new solution must be found to satisfy all users.
The multitasking AES will be in that way modified, so that
more than 8 windows (maybe max. 127 or 255) can be opened
on the desktop.
Message pipelines are like communication bridges between
parallel running applications.
Some new partition (Q,U,V,X, etc.) are used for:
Pseudo drive partitions
Device Drivers
Activated Processes
etc.
Accessories (in the old fashion way) are not needed any longer
for two reasons:
a) we have now CPX-Moduls for the X-Control Panel
b) we can run many applications simultanously
MultiTOS contains a lot of Unix features and comes closer

to MultiFinder.
The limit of the DOS-typical filename with max. 8 characters
plus 3 characters for extension ("1ST_WORD.DOC") will be eliminated
and in future also longer Unix- or Mac-typical filenames
accepted ("1stWordPlus.Document.Backup.1").
If under MultiTOS one of many parallel running applications
should crash, then the others remain protected and safe,
but under Microsoft Windows the user in that case has to
re-boot his PC while losing datas.
The desktop of MultiTOS looks like in MultiGEM.
The quantity of used accessories, opened windows
and started applications depends on the memory size (RAM)
of the computer.
Any way, for professional users is 4 MB and upwards recommended.
The screen will show the private (if any) desktop of the
last activated application.
It is better when the applications don't use own desktop,
so it saves a lot redraw or refresh time and the system's desktop
is available in the background with drive icons and trash icon.
MultiTOS Availability:
Beta Test Version for Developers now
Final Version after Summer 1992 (maybe after ATARI Messe 92)

Falcon030

Technical Specification:
HD Floppy Drive 1.44 MB 3.5"
CPU MC 68030 16 MHz
Signalprocessor DSP 56001 (like in NeXT)
Blitter
RAM max. 14 MB
Internal Harddisk optional 2.5"
Interfaces: Centronics, RS 232, LAN, DSP, Mouse,
Joystick, Stereo, etc.
Resolutions (only colour):
320x200/16
640x200/4
320x480/256
640x480/16
800x600/256
640x480/65536 (16bit)

Use gnutar which works together with Mint. Also, for tar to work on
the floppy directly you must have a raw floppy device. Someone wrote
and released one; I forgot who, but the package is called ps0.zoo (the
device name under mint is /dev/ps0). It works great, and you can even
use multivolume tar's (provided you use gnutar on the Sun as well).

Steve,

My congradulations on an exellent summary mate. As an other little thought
GEIS who operate the various GE services also offer nodes to GEnie in
most countries worldwide. Coupled with the the availablity of PDN access
from most cities world wide GEnie is IMHO the most acessable system in
the world.

I personal have used it from USA,London UK, Frankfurt DE, Hong Kong,
Australia and of course use it on a daily basis from here in NZL.

^^^^^^^^^^^^^^^^^^
Well, if you're gonna do sex in a safe, you'd better practice! <grin>

To answer your question though, the VAULT201 program will backup a file larger then 720K onto a disk. 'Course you'll have to use it's restore program to restore it if you ever need to.

BTW, if you're useing the default '.LZH' extender when you create your backups, you don't have to tell LHA that. Just use 'm /r <drive> *.*' and it'll work fine.

Out of curiosity, why are you useing m (move) instead of u (update)? Doesn't m delete the file from your drive after it adds it to your backup file? If you're doing it to 'clean up' the drive, you might as well save yourself that step and just re-format the drive after backing it up. That way you'll keep the drive running at top efficiency as well! (I do that about once a month myself. Can't stand a 'slow' drive!)

Hmmm...My experience with Atari and viruses has been starnge as well. When you run these programs VKILL or AVK they seem to find the little critters and get rid of them, but I have yet to see anyone who has had any damage to their system as a result of a virus. I think your probably safe. The Atari community seems to have better things to do then write viruses to hurt an already lagging computer platform. If you find anything out of interest please post it. Good luck.

Hello out ther in the net,

I've realized that were are a few people who are interrest by the ACS from Maxon Computer. Im just in the german army and have used the evenigs last week to sit in the sun and translate a test in one of our german ATARI-magazins about the ACS from german int english. You can read it in the next message.

At first (second) I want's to say: sorry for my bad english but I hope, you can understand the text and it will help you.

The original german text is from the TOS-magazin 3/92 and it was three sides long (smal printed text). I've tryed to abridge the text without cut some important things.

/// Thomas_Leonhaeuser @ F.maus.de. ///
/// Mailbox: Frankfurt a.M. MausNet ///

5167. Maxon ACS test (2/2)

Newsgroup: comp.sys.atari.st
Date: 1992-05-17 13:00:00 UTC
From: Thomas_Leonhaeuser@f.maus.de
Message-ID: <A8399@F.maus.de>
Source record: 221874

here is the translation of the Text:

############### translation start's here ##

In the ACS (Application Construction System) is included a RCS but it has much more functions. The ACS try to organised the bigest part of the event-handling when you create the grafic outfit from a Application. A GEM-object includes not only his phenotype. There are some others atributes. A part of these attributes are given and other you define if you class a object with an C-function.

What are you get for 198.- german marks
- a dubble sided floppy Disk
- and a german documentation that size is about 150 sides

ACS has three parts: The programm, a header file for the language C and a functionlibarary (without Sourcecode). Also there are a few examples which wants to show how to write a owen application.

The ready output from ACS is a objectfile (Digital Research-Format) or a C-Sourcefile that you can translate with Turbo- or Pure C (In the moment only this two C-Compilers)

If you want's to get a startable programm you must link all C-librarys, the new ACS-library, the ACS output and minimum one other C-modul whith the main-function.

After you start the program it present itself with three Icons and a very smal menu. the programm ist 200 kBytes big. Now where is the question, where are the functions who need these size. After y dubbleclick on the "new-Symbol" the programm opens a window with the name "partcategory" in witch you can define the programmstyle and how the ready programm react to userinputs. Now you can see where all that KBytes used. The window has a menu to.

worth mentioning is that the is written with itself. The parts spitt off in two parts: With the thirst you can create new components for your programm. In the second you can use to list and view the components.

You can create: Windows, menus, popup-menus, general GEM-objects and alert-boxes. You can class a C-function with a menuoption whitch in the ready programm will be called if the user select thes option or he pushes a defined key.

With help of a big dialoguebox, whitch size can be bigger than the size of the can shown on screen, you define all windows witch the ready programm must have. You can say there also the name of a C-fuction. You can open windows until there is no more memory left. If GEM can't give any windowhandels because there are too many windows opend, ACS close the lowest windows but it exist still

with its organizatonal data's and you can open it with a single keyclick.

If you think that ACS dont create any recource-files and so it dont need to use defined convention where is the possibility to automate much more.

Don't clear is for witch group of users is the programm written because for the new GEM-programm writer's the documentation is to small. For "GEM-gurus" who possibel have a own libarary there is the question if he will use these relativ rigid conception and have confidence to the ACS-functions.

The price who is about the dubble of a very good RCS don't make the decision easyer.

VALUATION

name: ACS; Application Constriction System
price: 198.- german mark

+ : - much functions
- safety in operation
- just without competition
- easy transvere from standard GEM-programms

- : - you must accustom to the concept
- very small Icon editor

= : Who must write very fast a GEM-programm have no other opinions.

############## translation stop's here ##

I hope you have understand these bad english. If there are any questions about the text write to me (Next two weeks offline sorry). Ohh the programm is complete (!) in german.

bye
Thomas

I believe it is correct that the Atari Monochrome display is refreshed at 70HZ, (or 72), while the color monitor is a mere 60HZ. If this is so, why is it that an Amiga (which has the same resolution and the same 60HZ sync) looks so flickery compared to an SC1224? Is the SC1224's display non-interlaced, perhaps?

5172. Atari eqpt. donations wanted for private school

Would greatly appreciate donations of Atari computers and peripherals, 8-bit and especially ST. We use them a lot at The Einstein School in Charlottesville, Va., a small private school for dyslexic children K-12. Good tax-write-off, and a good home.

520ST's and any STacy would be greatly appreciated at this time. Broken eqpt. is also welcome.

Thanks for considering us.

> worked...is there a special trap or macro?
>
> Printing chars out doesn't seem to be a problem at all, just
> reading them!

The GEMDOS calls work, but you may be looking for the wrong kind of
information from them.

On U.S. domestic machines, the keyboard is not set up to produce
codes outside the ASCII character set, which runs from 0 through 127.
Keyboards for machines sold in Europe have different layouts that can
produce accented characters, etc., with a single keystroke. With TOS
2 and 3, you can generate out-of-range keystrokes by using the alt
key and the numeric keypad. (There are alternate keyboard drivers
that can change these behaviors.)

Try this program:

```
#include <osbind.h>
#include <stdio.h>
main()
{
unsigned long l;
l = Cnecin();
printf("%08.8lx = %c\n", l, (int) (l & 0xFFL));
}
```

Note that the GEMDOS calls return LONG (32-bit) values, not 16- or
8-bit codes. The format is like this:

```
Bits Meaning
---- -------
0-7 ASCII character code, if there is one
8-15 All 0
16-23 Unique keyscan code (0 if the console is redirected)
```

One set of documentation that I have claims that the following values
are encoded in the upper word:

24 State of right shift key
25 State of left shift key
26 State of control key
27 State of alt key
28 State of caps lock key
29 State of clr/home key (or right mouse button)
30 State of insert key (or left mouse button)
31 Reserved

However, experimentation shows this not to be the case. You can get these values by using the Kbshift(-1) function, which returns the values of those keys encoded in bits 0-7 instead of 24-30.

The unique keyscan code that is assigned to each key on the console makes it possible to differentiate among similar keys -- say, for instance, the 7 on the typewriter keypad and the 7 on the numeric keypad. It also makes it possible to differentiate among the keys that do not correspond to ASCII codes, such as the function keys, arrow keys, etc. For example, function key 1 is 0x003b0000, since there is no ASCII code for a function key.

If you hold down the alt key and press an alphanumeric key, the keyboard generates the correct keyscan code, but the ASCII portion of the key value is 00. Using this information, you should be able to write a keyboard input routine that converts alt-e to an e with an accent acute, or alt-E to an e with an accent grave, if you so desire.

Because 32-bit values are not easy to handle with a C compiler whose ints are 16 bits, the dLibs getch/getche functions return an int that is constructed by shifting the keyscan code into bits 8-15. The resulting int is easy to process in a switch-case construct. See the dLibs documentation and source code for details.

Incidentally, if you're writing a GEM application, don't use stdio or GEMDOS or BIOS to read the console. Use the event manager, which returns keystrokes in a 16-bit format similar to that used by the dLibs getch function. The evnt_multi call and the much easier-to-use GEMFAST evnx_multi call can be used to make the state of the alt/shift/etc. keys available.

I was using m because I copied all the contents of a drive onto a separate
partition before backing up. I have been backing up over the weekend as it
happens and have been using a /r drivename.lzh *.* on the drive and moving
the subsequent file onto the backup partition. This is due to the fact that
I have so many files on my drive now that this is the only way to do it.
As it happens I usually backup and run a defragger on each partition (that
also has the advantages of telling me of any problems with the drivwe itself
.)
Thank you for the information, looks like I'll have to get a copy :-)

> 320x480/256
> 640x480/16
> 800x600/256
> 640x480/65536 (16bit)

This is very good news. That 800x600 resolution gives 480,000 pixels
as against the 256,000 pixels of the present 640x400 pixel mono display.
That's almost twice the screen area! This will help with having multiple
applications running in different windows. Plus it allows you to use
relatively inexpensive monitors, like an NEC Multisync GS2A (I bought one
new for $180; it's real nice with a swivel base and 14" flat screen).

4>Ever heard of the Mega Bus Slot or the VME bus ?

Wrongo.. the Mega has an "expansion connector"... NOT a "slot"

There are maybe three, or four, products that EVER were released to plug into the Mega expansion connector.. not exactly an "open" architecture..

The VME "slot" on recent Atari products is, admittedtly, an attempt to gain some kind of "expandability" for the computers. Unfortunately, the Atari implementation of VME is extremely limited, and FAR short of a true VME bus "slot"...

Atari Corp themselves have said that the FIRST "expandable" Atari computer is the TT...

Everything else is just a hack...

BobR

(Sorry, but somehow your right to "tell someone to get out of this group" doesn't seem to fit into the "real world"... try again when you have some "real" grasp of reality...)

The 74LS types can cause trouble regardless of manufacturer. It sometimes helps
to replace them by 74HCT types. You should replace both 74LS373 *and* both
74LS245 (which are positioned in one block together on the PCB).

5189. TOS incompatibility problem

Newsgroup: comp.sys.atari.st
Date: 1992-05-18 07:48:54 UTC
From: doucet@ripolin.laas.fr
Message-ID: <7458@laas.laas.fr>
Source record: 222020

Hello happy netters,

I've a problem: last Saturday, I've bought a game pack
(2 games for the price of one) including First Samurai
and MegaloMania.

FS don't run at all on a 520STE TOS 1.6, but perfectly
well on a (2.5Megs) 520STE TOS 1.62.
I don't think it's because of the memory size.

Looking back at the box, I've found (written in very
small characters): "F.S. doesn't work on old STE ROMS".

I'll take back the game to the store;
BUT, I'd like to know why is this possible:
what are the differences between 1.6 and 1.62, other than
the med-rez problem. Would STEFIX (or is it FIXSTE ?) fix
this one ?

Has anyone any idea ?

5190. BUYING ATARI PRODUCTS

Newsgroup: comp.sys.atari.st
Date: 1992-05-18 08:40:29 UTC
From: mark.thomas@rose.com
Message-ID: <1992May18.074031.18912@rose.com>
Source record: 222016

Date Entered: 05-18-92 03:32
Thank you to the persons who responded to my post about not being
able to purchase an Atari Megafile 44. I will instead by a Syquest 88
and an ICD controller.
Back in the recesses of my mind ;-) I wonder what this purchase is
going to do to Atari. If everyone buys third-party equipment, does not
Atarti hurt financially and does it not hurt future development at
Atari. Several post mentioned that I should not be concerned with the
Atari label. But if no one buys Atari brand, where does that leave us?
A number of posts back, someone was wondering where the large ads
for ST C compliers went. Perhaps they were unprofitable in a world that
seems to want a PD version. Just a thought....

An article in this months ST FORMAT says that a 'clipped wings' version of FSM GDOS which loads as a CPX in the new control panel is now (or will be in the next week or two) available from ATARI UK. They've even got a screen shot of it installed (just an entruy in the CPX list though).

>But exactly this is the aim of Atari. The Falcon/030 with the price of
>about $1300 is designed as a Consumer-Product, for games, etc., and not for
>office-computing.

Huh? No one is going to buy a $1300 machine just to play games.
Thus, I can't see that it is designed with a game image in mind. The
1040 case does seem to "scream" home computer though. Maybe that's
what Atari is getting at. Kind of unfortunate, though, that there are
people who might not buy it just because of it's look and its
home-computer image. Many people want a more powerful/professional
looking computer or just the convenience of a separate keyboard.
On the other hand, there are people who would buy it because it
looks more like a home-computer in a 1040 case and, probably a bigger
reason, because it's cheaper (I've heard 1040 case is ~$100 less than
Mega style case).
A nice solution would be if they could release it in both formats.
But this is probably not feasible or too costly.
An interesting solution would be if they could make a ~$100-$200
upgrade that would replace the top of the 1040 case with a rectangular
top to give it that box look (and more room for internal upgrades :)
and add a separate keyboard, maybe via a built in modular jack. This
look could be sold from the dealer with the upgrade installed.

Then again, Atari hasn't released anything yet, so they could still
surprise (or disappoint) us. Let's wait and see what they actually
release it in.

(hoping for a separate keyboard...)

5197. questions about MX2NET

Newsgroup: comp.sys.atari.st
Date: 1992-05-18 10:37:16 UTC
From: jjevissc@cs.ruu.nl
Message-ID: <1992May18.103716.61@cs.ruu.nl>
Source record: 222029

I have some questions about the MX2NET program
written by Fred Brooks. This is a program to use
eachothers drives via MIDI or the RS232 port. Can
anyone who uses this or knows anything about it
mail me.

1. Is it possible to use MX2NET via RS232 with only
pins 2, 3 and 7 connected like some flightsimulators
and terminalemulators do ?

2. How do you let the program know which computer is
the host ? Or is this not nessesary ?

3. Is it possible to open a remote drive from desktop
and read from it (if correctly installed) or do
you have to write your own program.

Thanks,

My understanding is that Questor's 2.01 Lharc adds 'Atari' to the files so that you know where they come from. ie. since it is compatible with the PC Lharc (and others?) a file from a PC would say 'PC' or 'IBM'. Kind of a nice touch.

>Is this customer support, you can say what you like about Atari,
>but for ME its DEAD...

Seems strange... why were you dealing through OZ in the first place??

I enquired at a local retailer when I needed my DMA chip done (about
a month ago), and I was told that they had none in stock, but they should
by the end of the week, so I held onto my computer and he gave me a ring
when they arrived :-). It was suppost to take 1 day to be fixed, but
they slacked around and it took a week. It cost nothing to me.

I can't really moan about a week to fit them for free can I.... down here
Atari is not dead. We have just started a user group & have about 50 people
willing to pay a years subs :-)
Things are looking good!

Nobody's going to hand things to you on a plate thesedays, you gotta go looking
for it... here we're putting a lot of effort into supporting the ST, and it
looks like we're pulling it off ok!

Craig.

>hundreds of files, that would explain things.
>

I added 40 files to the previously non-existing archive. The overhead is well in excess of 14K per file (600000 bytes / 40 files). Ordinarily the compression report (given during compression or as a result of a verbose listing) is quite accurate, and the overhead is taken into account in the quoted compressed file sizes. But in this one odd case (one other user, and only one, has mentioned similar problems) there's 14K per file added... since I can't say for certain it's "header info" I just say... "600k was added that isn't accounted for"

humm... roumor has it this problem dissappears when lharh2.01k is used. Anyone out there that can tell me where to fetch it from?

The "-L" option is only available on the Sun386i Systems NOT the Sparcs - On a Sparcstation you should:

fdformat -dlv

-d : MS-DOS file system
-l : low density (720K)
-v : verify after formatting

the device defaults to "/dev/fd0" so you don't need to
specify one unless your Sparc has two floppies (I have never
heard of a Sparc with more than the internal floppy)

>Then as a super-user, do 'mount /pcfs'.

Easy! Mount the floppy using the command "mount -t pcfs <directory>" then just use it as a normal Unix filesystem.

When you've finished cd out of the disk and type "umount <directory>" then "eject" to get it out of the machine.

The only problem is that by default you'll need to log in as root to mount it, unless there is a program to do it which you can get from a comp.sources.[unix|misc] archive.

Is it *sold* for that price, or is it just a copy fee, which means that it can
be freely copied ? Does Atari UK *themselves* sell FontGDOS ?

I would be very interested in getting a copy of this.

>Atari.

I know I won't be the last response to this, but even my non-business like mind would never use this as a reason to buy a product from a company. Just think what kind of garbage would be out there if Atari knew "We're buying from you ONLY so we can help you develop better products".

Correct me if I'm wrong but I've heard that Atari's MAIN reason for being in business is to make money. That means putting out something for the least cost and the biggest profit margin. It seems like their Development efforts are only focused on trying to keep up with their competition.

Lauren,

I don't have any spare computer equipment at this time (just sold most of the old stuff unfortunately) but I'd be happy to donate copies of some of my software which many professional educators have enjoyed using to enahnce vocabulary and spelling skills. I'll send you CROSSWORD CREATOR II and WORD SEARCH CREATOR, our most popular software for educators and word puzzle enthusiasts. Both will work on any ST, 512K up, any TOS, in mono or color.

Send me your address via email and it's "in the mail".

Use binary mode when you ftp. The only time to use ASCII mode is when moving text files between DOS machines and UNIX (it will get those damn ^Ms out or into the file). ASCII mode will insert or delete charaters on you and mess up those compressed files big time. ALWAYS use binary mode and you will never be sorry.

5221. How can I revive a color 1040ST bought in early 1987

Newsgroup: comp.sys.atari.st
Date: 1992-05-18 21:50:58 UTC
From: mm@didsgn.uucp
Message-ID: <1992May18.215058.4958@didsgn.uucp>
Source record: 221955
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I apologize if this question has already been answered 1000 times but I am
was not familiar with this newsgroup before...

Here is the deal:

I have an almost never used color ATARI 1040st wich was bought in early 1987.
It has 1Mb of memory, color screen and 3 1/2 floppy.
Everything works but the floppy which chokes from time to time while booting.

2 questions:

1) Where can I get the floppy drive check/repaired/replaced ?

2) What must I do/buy to upgrade this machine to a 1992 level and
really do something with it ? (ROMs ? more mem ? add a hard drive ?)

Thanks for everything

Jean-Luc Chatelain

$100??? They might feel like CHARGING that much more for the case, but if the same sorts of materials are used in the 1040 as are in my Mega (i.e. plastic and a minimum of metal), the actual difference in manufacturing costs is probably around $5.

JUST released for the Atari LYNX:

RAMPART
LYNX Casino
Basketbrawl
Hydra
NHL Hockey (by the people who brought us SEGA's Mario Lemiux Hockey)

These games just got to Pacific software today. So the games will be in stores by the end of this week. No this is not supposed to be released. They are out.

Pacific also said that they SHOULD have Baseball Heros by the end of the month.

Why not? If he is willing to trade games by swapping the actual disks, then this request is not illegal! Now if he was suggesting that someone send him COPIES then I too would say that this is NOT a good public request.

Message-ID: <1992May19.013747.2071@mnemosyne.cs.du.edu>
Source record: 221953

Greeting Atarians,

I know alot of people out there have been looking for jpeg software for the Atari. Well, I have just finished porting Version 3 of the Independant Jpeg Groups software to the Atari ST. I am not to sure how well it will run on a machine with less then 1meg yet. If anybody has any problems you can mail me here. I am not including the source code because it is available on various ftp sites. In the archive is 4 files. The image for compression, the one for decompression, a readme file, and a useage file. I am sending the file to atari.archive.umich.edu. It will be available right away as /pub/atari/new/jpegv3.zip. Zip is available from A.A also if you need it. I have also tested the file with unzip 4.1 for unix. I may be willing to change the file to another compression format if there is a lot of demand.

John

5227. My first ST program!

Newsgroup: comp.sys.atari.st
Date: 1992-05-19 04:56:57 UTC
From: plate@cdsmn.mn.org
Message-ID: <1992May19.045657.15887@cdsmn.mn.org>
Source record: 221982

Well, today, I finally compiled up my first Atari ST program. Well, I ported it from a UNIX program I wrote actually, but anyway, it's the first program I've actually compiled, linked (and of course debugged!) on my ST! Yeah, I know, big deal, but I just wanna take the occasion to say thanks to you all for helping me to regain some enthusiasm for computing. This is, in my experience, the most helpful and friendly bunch I've encountered on the net. And of course knowledgable! When I mentioned that I was going to be getting an ST and asked for info, I was virtually "ushered in" to the Atari world. Now, hey, I'm an ST programmer (even if it is self-proclaimed)!

Regards,
Doug

FYI, the program converts Yamaha DX7 patch binaries to human readable form.

5228. A Few ST things for the first lucky caller

Newsgroup: comp.sys.atari.st
Date: 1992-05-19 05:38:48 UTC
From: rubin@Apple.COM
Message-ID: <67314@apple.Apple.COM>
Source record: 221983

I sold my Atari 1040 ST long ago. However, while I was cleaning
out the closet, I found a few ST things I did nto get rid of.

I have a legit, paid for copy of the Mark Williams C Compiler.
I suspect that it is a bit out of date as it is version 3.0, and
that was way back in 1988 I believe! It also includes a
Mark Williams C Source Debugger. I have 3 books with it:
1) Mark Williams C for the Atari ST
2) Mark Williams C Source Debugger
3) Mark Williams Resource Editor for the ST

I cannot find the disk for the resource editor. Was it part of the
main release? I have the original 4 disk set of Mark Williams and
the two disk upgrade set (disk 1 of the upgrade does not have the seal
broken yet, and 1 disk of the C Source debugger.

I also have some old issue of START (Summer 88, Spring 88, Special Issue #3,
Winter 87, Special Issue #2 and Oct 88 (the last two have the disk inside, the
others do not have disks). Also, I have three issues of Compute Atari ST
(Feb, April, Jun 88) with one disk.

If this has some worth to you, give me a call and make me an offer. I know
its an old compiler, but it worked back then. Perhaps $25 for all? That
was less than the cost of the upgrade!!!!!

If no takers, I'll end up giving it to the best offer, be it free!!!! :-)

Owen Rubin @ (408)974-4928 during the days.

> (i.e. launching it with a sitename "uuwork equinox")

This is the normal way of using uuwork to replace the old mercury poll
program for direct calls. If you want to call out at a specific time daily,
you have to fill in the time in a field in XHOSTS, It's pointed to in
the documentation for SXHOSTS. Don't touch HOSTS, as XHOSYS now maintains it.
Re: Environment Variables. All the items in config.sys are replacable by
environment variables, even if you just assign them in the shell script file
you use to run the Hermes programs.
If you're having problems with a mismatch of your .D and .X files, and
you're using batchmai.ttp of version <1.03. Verions up to this release had
a problem if the processor or harddrive was very fast. Very short messages
also caused problems. As I understand it, the random article name generator
was using too coarse a seed, and would generate the same name for 2 successive
messages, the second of which was ovewriting the first. This of coures got
the .D and .X files to get out of sync, and caused a great hassle, with mail
going to the wrong people.
To understand Hermes, a German dictionary, or setting up and running
Mercury for a while are good ideas. There's still some shortcomings to
Hermes, like the lack of a newsreader as powerful as trn, or even rn, but
I've found it's transport mechanisms to be quite reliable, since 1.02 at
least. Expire also is quirky, if you accidentally get files in your news-
directories with dates too far in the past, for instance if playing a game
resets your system clock and you don't notice. (Anyone else have this
problem?)
If you need any other help, feel free to e-mail me.

>Wrongo.. the Mega has an "expansion connector"... NOT a "slot"
>
>There are maybe three, or four, products that EVER were released to plug
>into the Mega expansion connector.. not exactly an "open" architecture..

You're using a rather non-standard definition of "open" here, aren't you? The mega bus specs and timing are available to all licensed developer's and have been since the machine was released. The number of items doesn't define the "openness" of the architecture, just the willingness of hardware developers to expliot that. And you count is of by a fair margin as well, as almost all of the new crop of graphic boards are all available in a mega bus configuration, and that doesn't count the moniterm, the new 2.06 card or Dave Small's megatalk board either. Just because something is underutilised doesn't mean it doesn't exist.
And what do most pc users put in their slots? Serial cards? Graphic cards? (You have to have SOME kind of graphics card to hook a monitor to the pc) Parallel interfaces? Joystick /mouse cards? Hard drive ports? (ask any pc consultant about the joys of hooking more than one drive to a pc.) And of course you need a sound card.
Now you may have noticed that most of the cards used on the pc bus are unneeded on an st. Plus it's one heck of a lot easier to chain a bunch of drives to the acsi port, at least with an ICD card.
I'll be the first to admit that the ST has slipped in the running against pc's in the bang per buck range, but bogus arguments like you usually come up with, Bob, are unbecoming of someone who holds the position you do on an online service.

because I prefer to work from a text based shell, rather than from
any kind of desktop, I often got the problem, that many programs
couldn't find their RSCs. I solved this problem with a little
program, that, started from the AUTO-folder, installs a reasonable
Environment for the AES. In this ENV, the PATH= variable is set to a
central RSC-folder, where ALL of my RSCs reside. Furthermore I never
had similar problems any more. With MiNT, this could be done by
setting the appropriate PATH= in MINT.CNF

I recall having a similar problem with Timeworks DTP once. There wasn't enough
free space on my hard drive for the temp files that Timeworks produces when
it prints, and the result was a page full of frames and blocks, but no text.
Check your drive free space, it may have something to do with your problem.

Hatari!

Does anyone know a program for the ATARI TT, which supports virtual
memory? I would prefer Public Domain-Programs, but I also would like
to know about commercial products.

How do these programs work? Are there any serious bugs?

Why does the ATARI OS _not_ support the virtual ram?

Thanx, Roland.

You need the `mtools' package for the Sparc (be sure not to get an old version).
With this, you can format, write & read IBM (read: ST) compatible floppies
on the SparcStation. I did this last year, so I don't know what the latest
version of mtools is, or where to get it.

>cu
>Michael

The ST Club has a license to _sell_ GDOS from Atari, so it's not PD,
Shareware etc. They also sell 'regular flavour' GDOS under the same
agreement. I don't know if Atari UK themselves sell FontGDOS.
Incidentally, I get the impression from this month's ST Format that
FontGDOS is the 'cut down' FSM-GDOS for 0.5 Meg Machines - FSM needs at
least a meg apparently (and Format are claiming the full version will be
on sale in a month in the U.S. (!) for $50).

ST CLUB: 2 Broadway, Nottingham, England, NG7

Disks: GDOS - E (cat. number) FontGDOS + drivers for FX80, BJ10, HP
DeskJet and others.
GDOS - F : Atari Laser version.

They take international orders, but not credit cards.

(This is a posting for a student without posting permissions - any replies should be addressed to csw69@seq1.keele.ac.uk or this newsgroup.)

(--------------- Start of included message -----------------)

I'm thinking of writing a midi sequencer for the atari, probably in C. What I would like is information on how to get started, good books to look at or maybe somethings you've discovered for yourselves. I know there's plenty of good stuff already written (sequencer one springs to mind, this came free on ST FORMAT) , but I'm thinking of doing it for my project next year and it gives me a chance to mess with some keyboards and drum machines. :-)

P.S It's a 520 FM this should be ok shouldn't it.
P.P.S. I've already been sent the MIDISPEC PACKAGE.
P.P.P.S At the moment my knowledge of C is minimal(ie bad) is this too difficult do you think?

There not too bad eh?

If the article you got your pictures from was the magazine ST Computer, you
saw a fake picture. The note under the picture said that the pic was
supplied by (an) Apple which probably means that it was done on some
DTP system on the Mac. It verymuch looks like a scanned 1040 painted black
with the letters Falcon 030 just added. The whole article was based on rumours
they gathered from the C-Bit, but bits of truth are probable in there.

From: cscullio@ncratl.AtlantaGA.NCR.COM
Message-ID: <53288@ncratl.AtlantaGA.NCR.COM>
Source record: 221967

I've tried several times to get the 1.33 version of Sozobon C (Heat and serve version) to work with no success. I find that, during the installation program, it aborts because it cannot find JAS.TTP. I've checked the packed files and, sure enough, it's not in there. Is there a version of the archived package which contains this file? Should I just manually copy an older copy of JAS.TTP to the appropriate directory before running the install (not very 'heat and serve' that way)? Any info much appreciated.

>Rosenquist monitors this newsgroup so he can probably tell you
>for sure, however, There's nothing to stop you from uencode the
>files and send them that way.

STalker 3 supports the ZModem "escape controls" capability, although this does not necessarily mean that you'd be able to send a file over a 7 bit data link. ZModem normally encodes certain control characters (^S ^Q ^P etc. as well as the versions of those characters with their 8th bit set) so that they don't get interpreted by the devices along the data path. Use of the "escape controls" option causes the ZModem sender to encode all 7 and 8 bit control characters (ASCII 0-31 and 128-159) rather than just a few.

ZModem still needs to be able to send characters above decimal 159 though in order to transfer a binary file (assuming the file contains 8 bit data of course). As far as I know, Chuck Forsberg has not defined a way for ZModem to operate on a 7 bit link. He's made a few changes to the ZModem "spec" since it was last publicly released, but he's chosen to keep those proprietary to his own products. The unfortunate result is that ZModem is unlikely to progress much further since enhancements by anyone other than Chuck will not likely be considered "standard", and his enhancements have all been proprietary lately.

Not particularly. The font technology for FSMGDOS IS based on the PC-world.
That's one of the reasons that Atari is going to have to charge for the program
in the first place (royalties, don'tcha know...) The folks who brought you
UltraScript (the PostScript emulation software for the Atari ST) are also
bringing you the fonts for FSMGDOS -- and these are PC-based fonts.

The only problem I've encountered with FSMGDOS and WordFlair II is with a
96-point calligraphic-style font, where the letter 'g' gets cut off about 2/3
down the descending stem. Otherwise, it prints perfectly on an HP DeskJet
printer...

>>setup, and so forth.

That's true of a lot of systems. I remember when I was happy with a 1 meg,
floppy only ST. Then I discovered the GCC. It grew to a 4 meg machine with
hard drive PDQ.

Or my new 386PC. Bought to run Linux (_not_ DOS, though I'm deeply ashamed to
admit that I own DOS 5 :-); came with a 40 meg drive. Seemed adequate on the
ST. Boy does that GNU stuff suck up space! Only a few months after buying the
PC, I decided that I'd have to invest in a 210 meg drive.

>Every PC owner I've known seems to NEED to replace his/her system
>about every 2-3 years. PCs are definitely money pits.

My ST was turning into a money pit. The PC has solved all my problems in one
(well, two) fell swoop(s). The ST needed - accelerator board; a mono monitor
(why the hell should I have two monitors for one computer?); bigger drive.
All that was going to cost me more than a new 386DX-33, so that's what I got
instead. I've not regretted it for a minute. (And I got a *real*, *free*
UNIX too!)

Well, considering that this rumor is correct... what systems are around in the
PC-world? The only system I know would be the ADOBE Type Manager (for Windows).
Would be kind of neat, eh?

>costs is probably around $5.
>

I do not mind the 1040 style case. Hoever, I'd like to see a few changes made
to it.

The keyboard should be a little lower (if possible) so your hands don't get
tired when typing that much.

The keys should be more comfortable to press.

And the joystick ports should be easier to access.

Besides, I'm sure Atari will make the same version but faster (maybe 33 MHz)
in a PC style case. But I'm sure it will cost more as well.

I don't like the Mega STe/TT case that much at all. The reset and power
switches should be in front of the machine so it is easier to access.
The monitor shouldn't extend over the computer because it looks stupid.
I have no idea why they separated the computer from the drive. Why not allow
the user just to open the case and slip in the hard drive?

But I heard the keyboard isn't that bad.

I'm interested in adding a color tube and noticed a number of delaers selling a Magnavox 1CM135 "stereo" monitor. It's a 14" tube and cheaper than the SC1435 by $20-30, plus has inputs for composite video as well. Anyone have one, care to comment on picture quality, is it really compatible with the ST, etc?

Second question is a request for opinions on Rising Star Computers, who advertise in Atari Interface. They are a mail-order house in Ohio. They have the most complete listing of educational titles I've seen anywhere and they have the usual hardware goddies like hard drives, monitors, etc. considerably cheaper than Toad. Comments on dealing with these guys?

E-mail preferred but feel free to post here if you like.

I think you have got your facts wrong, Atari does not make Hard Drives any
more.

So how can bying a third party drive hurt Atari...???

>computer is the TT...

It seems to me that there people can have different points of
view regarding the question whether the ST is an open
(expandable) or a closed system.
From a logical point of view, one can say the ST is open because
there are the ACSI bus in all STs and the mega bus in the Mega
STs. This clearly makes sense since there are expansions
available such as hard disks and ethernet adapters for the ACSI
bus (with a PC, these are done using a slot), and graphics
expansions for the mega bus (another thing that a slot is used
for in the PC world).
From a technical point of view, expansions of the ST are more
"hacky" than they would be with a PC. Expansions using the mega
bus have the difficulty that space in the case is quite limited.
However, I have read in the ST Profibuch that there is a standard
format for mega bus cards. With ACSI expansions, the problem of
space does not arise, however, things are more costly because
they need a case and a power supply of their own.
From a practical point of view, one might argue the ST is less
expandable because there are not as many expansions available for
it than there are for the PC. However, it seems to me that this
has little to do with the expandability of the system, but rather
with the fact that the market for ST expansions is smaller than
the market for PC expansions. This is certainly an important
issue, but I think it's not quite precise to describe these facts
by "the ST is not expandable, it's a closed system".

Arriving soon at atari.archive.umich.edu:

Patchlevel 20 of the MiNT libraries. This version will support gcc 2.1,
and incorporates Scott Bigham's patches for Sozobon 1.33i (thanks,
Scott!). There are also miscellaneous bug fixes, including some
very important fixes to osbind.h. (see my next message if you want
details).

5253. SERIOUS bug in gcc and MiNT libraries

Newsgroup: comp.sys.atari.st
Date: 1992-05-19 18:53:54 UTC
From: 7103_2622@uwovax.uwo.ca
Message-ID: <1992May19.145354.1364@uwovax.uwo.ca>
Source record: 221973
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

There is a horrible bug in the header file osbind.h for both
the MiNT library (patchlevel <= 19) and the gcc library
(patchlevel <= 80). The binding for Bconmap is incorrect. The
Xbios function number for Bconmap should be 0x2c, *not* 0x2b.
0x2b is the function for DMAwrite!!!!

DO NOT USE THE Bconmap BINDING AS PROVIDED IN osbind.h. DOING
SO COULD CAUSE DAMAGE TO DATA ON YOUR HARD DISK!!!

This bug has been corrected in patchlevel 20 of the MiNT libraries.

Source record: 221975

> Sozobon v1.33i (HSC) ... JAS.TTP not in the .PDF file

1.33 has been out for at least 6 months now, and this is the first report I've heard that JAS.TTP isn't in the package. I'm not quite sure what to make of it... It seems that if this were so, I'd've gotten a lot of reports about it by now.

When I originally distributed 133i, it was as a .LZH. I hear that someone converted it to a .ZOO, but I don't see how even that would cause a file to disappear from within one of the .PDF files.

The .PDF files are really .SFX archives, slightly munged. You can rename a .PDF to .TOS and run it to 'manually' unpack the files. You might give that a try. Unfortunately, the sfx process is pretty stupid about catching errors (like disk full and so on), that's why I have the install program double-check that all the crucial files unpacked okay.

In general, I don't recommend using mismatched compiler pieces, since they are released in sync. For example, pre-133 versions of JAS had a fatal bug in assembling the BTST.L instruction, but the pre-133 HCC and TOP never generated such instructions. When I fixed JAS to handle the BTST.L correctly, I enabled some new optimizations in TOP to emit BTST.L. If you use an older version of JAS with the newer TOP, the older JAS will emit random opcodes for BTST.L, and your programs will mysteriously crash at runtime.

The reason is the old lev algorithme that breaks when used on compressed
data (with the same algorithme. I once tried to compress a uuencoded
compressed file of about 10 Mb the compressed file filled up the complete
200Mb (30%-80% freespace) filesystem I was working on (was a Unix machine).

Later version of lharc/arc/zoo use a better version of the algorithme.

Source record: 221984

Distribution: world
Organization: Universidad Aut'onoma de Puebla

I have an Atari 520ST built around July 1985. It has TOS in ROM (version 1.3, if I recall correclty) with a Terrific Peripherals' EZ-TIME clock sandwiched between ROM #1 and its socket. It has a home brewed 2Mb expansion board using the "Push temp" MMU pin board and ribbon cable from a 512K Terrific Peripherals EZ-RAM expansion board. There are two external two-sided floppy drives (both Ataris).

The problem: My younger son ordered a copy of "Indiana Jones and the Last Crusade: The Action Game" from 1st Stop, an outfit that advertised in (the now defunct) STart magazine. The game was sent by a company called Rising Star. It didn't work: Booting from the first disk, the screen first turned blue, then the Lucasfilm Games/U.S.Gold logo on a black background was shown while the Indiana Jones theme played. Then it asked for the second disk and for the fire button to be pressed. Doing this caused an opening screen to be shown immediately after which the program bombed (eleven bombs, most of the time). Suspecting the homebrew board, I tried the game without the extra memory---same thing. Rising Star was kind enough to replace the disks _twice_, with the same result.

The questions: Does anybody have any thoughts on why this game shouldn't run on my machine? Does anybody know Lucasfilm Games/U.S. Gold's addresses? (no addresses are to be found on the box, disks or "documentation")

Your help will be appreciated.

>the graphics would be 800x600 in 256 colours or 640x480 in 65536 colours.
>Let's hope it's not just more rumours...

Yes, but the article also stated that it is a phantom picture of what the
Falcon might look like, done by a Mac recoloring a 1040ST photo.

On the other hand, Atari's newsgroup int the german electronic mail
service 'Bildschirmtext' (Btx) has a page titled 'Falcon 030'.
Guess what it states - "no details...", and that's verbatim.
However, this seems to indicate at least that Atari officially ack-
nowleges the existance of the beast...

Here's hoping the best,

Techno

5261. MIDI software

Newsgroup: comp.sys.atari.st
Date: 1992-05-20 02:04:49 UTC
From: azog@thoth.rent.com
Message-ID: <1992May20.020449.11199@thoth.rent.com>
Source record: 222077

I have some questions regarding MIDI software, but dont know if what I want to do, does exist.

Currently, I use Passport MIDISoft Studio, and up until recently, its been more than sufficent.

But lately, while recording, I want to get time signatures down exact, and have been using the step record function to lay down a basic track. My problem is, when I get one note wrong, I need to go back, and try to record the track over correctly. By that time, Ive forgotten exactly what I did (by concentrating on the music too much, which is they way it should be)

What I need is some software that will display what Ive recorded so far, in a staff format on the screen, and where I could hopefully pick out a single note, and change it there, without having to re-record the tract again, or trying to cut-and-paste it out.

Ive seen some notation software that lets you scale the music on a staff, so I guess what Im looking for is something that sorta combines that idea with the sequencer... I hope Im making myself clear, and not sounding like a babbling idiot! :-)

Does such a beast exist? And hopefully for not too much!

Thanx

Ok.. for the sake of argument, the ST is an "open" architecture..

How do you expand the memory..? Until the STe, you hacked and slashed, and prayed the mess would work when you were done. With the STe, you break the seal and void your warranty.

With a PC you plug memory into the provided sockets.

How do you expand your graphics capabilities..? With an ST you either just don't, or you hack and slash and pray the mess will work when you're done. If you have one of the barely existant boards for the Mega, you plug in the board, and make the expansion bus unavailable for anything else. Maybe, just maybe you'll be able to find one of those "coming soon" boards for the VME slot, if you have a Mega STe.. but that too fills the slot, making it unavailable for anything else.

With a PC you just plug a new graphics card into a slot.

How do you expand your floppy drive capacity..? With an early ST, you either just don't, or buy an expensive third-party drive that may, or may not work. Or you try to get the expensive Atari HD kit with the "Ajax" chip, and then you try to get it to work.

With a PC you just plug a new controller card ($29) into a slot and swap out the drive ($49).

How do you expand the sound capability...? With an ST, mainly you just don't. If you can find one (the company is out of business, remember), you can add a "Tweety Board", and while the sound is better than the normal internal sound, it's pretty much the same, split into three separate channels. Regardless, no one writes software to make use of the Tweety board, and hardly anything for the STe DMA sound is available. You have no choices for expansion.

With a PC you just plug a soundboard (Thunderboard $89) into a slot.

Does all this define the ST as a computer that's "open"..?

I think not.

Don't believe me... ask the company which MAKES the ST..

As I mentioned before, Atari Corp. has said the TT is the first Atari computer which is expandable.

BobR

(Mindless Atari Cheerleader comments like we've been hearing can be directed to device/null...)

John Henders writes:

> I'll be the first to admit that the ST has slipped in the running agains
>pc's in the bang per buck range, but bogus arguments like you usually come
>up with, Bob, are unbecoming of someone who holds the position you do on
>an online service.

Well, I don't know exactly what that has to do with anything,
but I do resent its implications..

While the ability to lie and cover up might be a prerequisite
for one commercial service I'm unfortunately familiar with,
being an Atari Apologist is NOT a prerequisite for "holding
the position I do on an online service".

You've made this allusion before John, and I can't exactly decide
whether you're jealous, or just ignorant.

Being of service to the Atari community and Atari users does not
require the wearing of official Atari rose-colored glasses.

I've made a specialty of helping new Atari owners learn to get
the most out of their computers, but I will NOT lie to them and
tell them everything is peachy-keen in the Atari world. If
necessary, I'll recommend a different kind of computer if it
will better serve their needs.

What have YOU done for an Atari user today..?

BobR

(By the way, I also won't lie to a new Atari user and stretch
having an ASCI port into having an "open" system.)

I am looking for some school-age educational software, as my youngest is now 5 and my older one 7 (i.e both are outgrowing the preschool packages I have now). I've found a mail-order source for some, but without a chance to even see the package, buying is a crapshoot (the dealer himself knows very little about the packages). I'm interested in hearing from anybody who knows anything about any of these:

Math Blaster Plus: this seems to be a good seller in other formats, I have never seen an ST version myself.

Bentley Bear: what are these? I've heard good things about General Store, bad things about Spelling Bee, there are about a half dozen others available.

Fun School: I have the under-6 version of Fun School 2. Apparently 3 and 4 exist *and* they are available scaled by age group. I am curious about the versions for over 7 yrs, are these the same games, just more difficult?

Also, recommendations for other packages are welcome, with emphasis on reading and math. I should mention I am in the US so I'm looking for English language stuff!

Atari is going to change the distribution of there products to STE's only here,
and only though Department stores.

No one is bringing in software any more here, all dealers that I have talk
to are going to close or change to the PC, the only dealer here in Wellington
has had his suplies of machines cut off..

Atari clubs here in the North Island are closing at a rapid rate, also Kmart
has droped the Lynx for the Game Boy, and no support for the Atari machines at
all...

Atari also just stated a 13.2 Million loss, so you think that Atari is
doing good, No Way here at all, go and talk to some of the dealers here
in the North Island..

Tell me were did you get your Hard Drive, not here was it..??

5271. Porting from Spectrum to Atari 500++

Newsgroup: comp.sys.atari.st
Date: 1992-05-20 11:55:17 UTC
From: d89-tho@nada.kth.se
Message-ID: <1992May20.115517.1245@kth.se>
Source record: 221996

My uncle would like to port a massive amount of text from an old spectrum to a sligthly modified Atari 500. Being very familiar PC's, Macintosh and Unix stations, I offered my help, thinking it would be easy. The problem is that he has next to no documentation on how this can be done and I am quite lost.

Since both machines have RS232 ports, linking them should not be a problem. Has anyone tried to do this before? Is there any standard software that can be used to assist in this process? Or do I need to write my own programs to send/receive data? If so, does anyone have any advice on how it could be done easily and quickly?

Waiting anxiously for good news......

Taquin Ho
d89-tho@nada.kth.se

5272. NeoDesk / Gemini comparison? and HSC

Newsgroup: comp.sys.atari.st
Date: 1992-05-20 12:25:03 UTC
From: tony@microware.co.uk
Message-ID: <957@mwuk.UUCP>
Source record: 222056
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi,

Can anyone provide a summary of the main differences between NeoDesk 3
and Gemini 1.21?

I have Gemini 1.21, and installed it on my hard disk OK, but with 1 meg
of RAM I don't have enough memory to run Heat'n'Serve C under it, so
currently I still use the standard TOS 1.4 desktop.

I guess I really need to upgrade my ageing STM to 2.5 meg.......

Gemini doesn't seem to be strictly a *replacement* desktop, but a
desktop program which is run or auto-run from the standard desktop.
Therefore both desktops are active and using memory. Is it possible to
set up Gemini so that after VDI and AES are setup, control goes straight
to Gemini *instead* of the standard desktop. This would surely save a
bit of memory. Which way does Neodesk operate in this respect?

Does NeoDesk have a CLI along the lines of Mupfel?

The Gemini docs warn of a problem with Sozobon C to do with a memcpy()
bug. Does this problem affect HSC 1.33i too?

Any other relevant comments gratefully received.

Tony.

I have spent a few hours playing this superb game, but have come up against a few problems - can anyone help..?

1: How do you find the bloody fuel pods? I always seem to run out of fuel before I can locate one.

2: How do I complete the first big space battle mission within the time limit (I can't remember the mission number - its the mission after taking out the Magma Cannon)? This ties in with my first question, since running out of fuel is a major handicap..

Replies by email are fine...
Thanks

As I've tried to point out in my last posting on this issue, I
don't think it's adequate to argue whether the ST is an open or a
closed system. It's much more helpful to state what you can do
with the ST and what you can't.
Therefore, I won't comment on your examples in public although I
could easily think of a more or less sensible reply to every
single one. But such a reply would be senseless because it would
not contain any useful information for most of the readers (if
someone is really interested on any further comments please mail
me).
Regarding the Atari quotation: I don't see it proves anything
except that Atari has some funny marketing strategies.

>Ok.. for the sake of argument, the ST is an "open" architecture..

Heh. Some concession Bob. But, since you brought it up, I'd like to take the time to quibble with the 'ease' you assume a PC-compatible grants you...

>With a PC you plug memory into the provided sockets.

And THEN you mess around trying to find the proper system software to allow you to USE the memory (Expanded memory? Extended memory?) which you have installed.

God help you if the application you want to run makes use of Expanded memory when you installed Extended memory. (This is, of course, getting less complicated, but then again, so is installing memory on an ST.)

>With a PC you just plug a new graphics card into a slot.

And THEN you mess around, cursing yourself if you bought the wrong graphics card for the application. Or you purchase yet-another-graphics-card. (This is, of course, getting less complicated with the 'standardization' of Super VGA, but then again, graphics cards for the Mega-series are easily plug-and-play as well...)

>With a PC you just plug a new controller card ($29) into a slot and swap
>out the drive ($49).

Gee, Bob. You have a source for 1.4 meg floppy drives for only $49?!? Why don't you let the ST world in on your secret so that we can lower the cost for the folks who have been installing 1.4 meg floppy drives on ST equipment for the past year or so.

>With a PC you just plug a soundboard (Thunderboard $89) into a slot.

Bob fails to mention that, with the STe, you don't NEED to spend an additional $89 to get great stereo sound. Of course, you could always purchase one of the stereo cartridges, such as ST Replay and its successors.

>(Mindless Atari Cheerleader comments like we've been hearing can be

>Being of service to the Atari community and Atari users does not
>require the wearing of official Atari rose-colored glasses.

Exactly which service to the Atari community and Atari users do you provide Bob? Directing them to Intel-486 computers that can run the GEMulator?

In the past six months of reading postings from you, I only remember one posting which provided an Atari user with some form of help. The remainder of your postings have read as bitter attacks.

>I've made a specialty of helping new Atari owners learn to get
>the most out of their computers,

Your postings in THIS forum certainly don't read that way. You'd do better to stick to 'helping', rather than taking pot-shots at everyone who thinks that Atari computers are fine.

>If necessary, I'll recommend a different kind of computer if it
>will better serve their needs.

Good for you. Just one thing, though. Such recommendations are better met through e-mail rather than through an Atari-ST oriented forum. Otherwise, one might suspect your motives.

>What have YOU done for an Atari user today..?

Let's see... I'm the president of the local Atari ST users group (MAST - Minnesota Atari ST users group); in a past incarnation I wrote a series of tutorials for writing GEM programs using OSS Personal Pascal; I write articles for our local user group newsletter (I used to edit the newsletter at one time as well); I've been putting the club DOMs together for the past year and a half [604 disks from February 1986 to May 1992]; I'm listed as the contact person for MAST in the local computer free-papers; I write the comp.sys.atari.st FAQ posting [I know, I know... sometime next week folks].

What have YOU done for an Atari user IN THIS FORUM?

>(By the way, I also won't lie to a new Atari user and stretch
>having an ASCI port into having an "open" system.)

I wouldn't lie to a new Atari user and deny that a Mega-bus or a VME-bus indicates an "open" system, either.

Um, aren't you choosing apples and oranges to compare? How did you
expand memory on origional PCs?

[Mindless Dos Cheerleader comments deleted]

>(Mindless Atari Cheerleader comments like we've been hearing can be
>directed to device/null...)

While today's PC clone is certainly more open and expandable than an
old ST, why should you (given your postion) argue the case? Why does
it offend you that some poor soul wants to believe in ST expandability?

Hey, I don't really care what you like (I happen to have several other
computers besides a Mega), but my unbiased opinion is that you come off
as an Atari basher, not as the helper you would like to think you are.
Sorry if that offends you, but that is what I hear you saying.

I've never had any success getting my kids interested in any educational software past the preschool level. I have Math Blaster Plus, and I'd sell it to you, but I'm still holding out hope that my kids will use it for flash card multiplication practice. It's advertised as the best-selling/most-recommended math education program in the world, but for the life of me, I can't figure out why. It's basically just flash-card drill, and maybe it works in a classroom setting, because you get points, and you can print out a certificate at the end. There's also a game, where there's a row of spaceships, and you have a limited time to figure out which one holds the correct answer to the problem at the top of the screen. When you select it, it blasts off.

I also have Bentley Bear's Math, which is no better: You have to get Bentley Bear to choose the correct answer to the problem on the screen, and when he does, he gets a jewel to use to make a bridge to go get some honey. It's slower-paced than MathBlasterPlus, even at its fastest speed.

My (and my kids') reaction to both of these, after playing for a minute, was: "You mean that's all there is to it?" Compared to the complexity of the games that are strictly for entertainment, these are incredibly boring.

I've heard that Donald Duck's Playground was good, but it went off the market before I could buy it. It apparently allowed you to roam over the playground, using coins to buy things, make change, etc. My kids have enjoyed adventure games, like Kings Quest III, where they get to roam around the landscape and type questions into the computer. This gives reading & typing practice, without the time pressure of Word Invaders (on the Typing Tutor disk).

Brian, without a doubt, the best source of educational software for the Atari ST for use by children is D.A.Brumleve. She has been around quite awhile and is a staunch supporter of the Atari ST _user_. Every time she brings out a new program, you can bet that it has been well tested by children and adult educators. She even has the services of an educational consultant, Michael Marks. Her latest, MultiPlay, is a superb math drill program with many unique features. She has a lot of material that is now PD as well so look for it in all the usual PD sources. See your local dealer or contact her directly at 217-337-1937. Oh yes, she's also a member of the IAAD (Independent Association of Atari Developers). ;-)

I have the following items for sale for the Atari ST :

CALAMUS - desktop publishing program $90

CALAMUS Outline Art - allows you to draw pictures $85
for CALAMUS

CALAMUS font editor - Allows you to create and edit $45
fonts.

These items CAN be re-registered to the new owner.

```
Develop C software on your Atari ST or STE :

Low-cost C development package
------------------------------

Laser C compiler and linker
- Shell with make utility
- Program editor
- Icon editor
- Resource construction kit

Laser C symbolic debugger
- Look at your source code as you
step through the program.
- Excellent user interface

Book "Application Programming on the Atari ST"
- explains how to use the system calls
- contains example programs

*** Asking $50 ***

Andy Hsiung,
If you see this message, send a phone number
where I can reach you. My e-mail cannot get through
but I can recieve yours.

5292. Help with laser printing

Newsgroup: comp.sys.atari.st
Date: 1992-05-20 21:35:00 UTC
From: blunden@ishtar.physics.umanitoba.ca
Message-ID: <20MAY199216355627@ishtar.physics.umanitoba.ca>
Source record: 222071

Does anyone know how I can get output from 1stword printed verbatim on a laser printer? I have 1stw2ps, but it is unsatisfactory for a number of reasons:

1) it tries to put equal spacings between words, which screws up tables in a major way;
2) it sometimes drops the underlining on certain characters;
3) it can't handle page offsets of more than 99 pages.

I have direct access to a postscript printer over an RS-232 line, and indirect access to an HP Laserwriter II from a mainframe. Any help would be appreciated.

5293. **** WARNING TO AMERICANS ABOUT POPULOUS II ****

Newsgroup: comp.sys.atari.st
Date: 1992-05-21 00:03:48 UTC
From: n8742883@rowlf.cc.wwu.edu
Message-ID: <n8742883.706406628@rowlf>
Source record: 222074

I just got my Populous II game today, and after booting it off of the floppy, I got a dialogue box saying "Sorry PAL machines only". I then called up Electronic Arts in California, and they confirmed my suspicion that Populous II can run only on European machines, and no American version will be created.

I called the store (Nybbles and Bytes in Tacoma), and they were surprised to hear about the incompatibility, as they purchased the software from an American software dealership. They were going to test some of the versions that they had and exchange my version for a working one, but I believe the phone rep. at Electronic Arts when he said that no Populous II exists for American Atari's, nor will there ever be.

It's a shame that this excellent game (I've seen it on an Amiga) isn't availible for the U.S. Anyone have a guess why?

Now I have to deal with a major problem (which I'll explain further in another post): I had to put the Populous game in the AUTO folder of my hard drive-- it boots up and crashes and I can't get access to my hard drive! Auughhh!

>> clipboard.acc can't find its resource file if any environment variables
>> are defined

>GEM uses the PATH= variable to search for RSC files. It looks first
>in the current dir, and if it doesn't find the RSC file there it
>looks in any paths listed in PATH=.

Please remember though, that simply setting PATH before running your
program will NOT help. You must set it before you run GEM - ie. from
your AUTO folder, or from MiNT before you run GEM (if your using a TT,
I don't think you CAN run GEM from MiNT just yet, so the reverse is needed).

There are small AUTO folder "environ" programs on atari.archive that
will help.

I have noticed that it has gotten a little warm (and noisy) due to this stupid ST/PC bickering..... Come on guys, there is NO winner, each machine has good and bad points, and 'best' is relative to the user, not some flaky idea of 'better than you..'.

I own several machines (PC, ST, MAC, UNIX) and I like them all equally, each has a place in my world. You dont hear ME bitching about who is better..... Please take this garbage elsewhere (ok. /dev/null will work for me...) and lets try to get along..... and maby LEARN from each other.....

Ziggy.

Flames NOT welcome........

5296. Help needed on hard drive problem!

Newsgroup: comp.sys.atari.st
Date: 1992-05-21 01:01:14 UTC
From: n8742883@rowlf.cc.wwu.edu
Message-ID: <n8742883.706410074@rowlf>
Source record: 222075

As I mentioned in an article that I just posted, I purchased Populous II for my 1040 ST. It turns out that Populous II has been made only for European Ataris, and will never run on American ST's.

Here's the problem:

When I got the game, the instruction manual said to make a backup of the disk and play the game off of the backup. Fine-- I made a copy of the game files into a folder on my hard drive.

The game (POP.TOS) refused to boot. After examining the files for a second, I saw that Populous II came with an AUTO folder on it. A file called "LOADER.PRG" was inside the AUTO folder. I clicked it, but it bombed with two bombs.

I then (big mistake here) placed the Populous II files onto the C: drive, and placed the LOADER.PRG into my boot drive's AUTO folder. In all attempts to run Populous II, the program bombed out and returned me to the desktop.

This time, the program loaded.... only to give me a dialogue box saying "Sorry PAL machine only" and then it locks up! Now, every time I boot up my ST, I can't stop it from loading up Populous II out of the AUTO folder-- every time I boot off of the hard drive, the AUTO folder kicks in and it locks up! In order to access my hard drive (which is a 50 meg MicrOtyme ICD special), I have to boot off of the hard drive to load up the device drivers; I can't turn the hard drive off, boot my computer off of a floppy, and then access the hard drive to remove the file out of the auto folder as the Atari doesn't recognize the existance of the hard drive as it didn't exist at boot time.

Does anyone out there have some sort of solution for me? I'm gonna try to find the disk that came with the hard drive which contains utilities for the drive and see if I can find anything there-- but I think this is in vain as I used ICDUTIL.PRG (I think that was the name) to set up my C: drive as the boot drive; even if I found the hard drive utilities disk and booted the system up with it, the hard drive will automatically take over and boot up from the C: drive. Help!

Thanks in advance,

Perry

>I recently saw a Sinclair ZX spectrum emulator for the ST.
>I want it! Anybody know where (and how) I can get it
>I assume it is PD.

If you have no luck getting the program, leave me a message in
Email, I might be able to track down a copy.

What I want is ZX spectrum files to run on it... without them it's useless.
The only way to do this seems to be through using an RS232 interface
on a spectrum.... you also have the problem of copyright, and they
still make & sell ZX spectrums from what i've heard !!!

Craig.

Newsgroup: comp.sys.atari.st
Date: 1992-05-21 01:28:17 UTC
From: jjung@aludra.usc.edu
Message-ID: <l1lv5hlNNgu@aludra.usc.edu>
Source record: 222078

In article <n8742883.706406628@rowlf> n8742883@rowlf.cc.wwu.edu (Perry Pederson) writes:
:I just got my Populous II game today, and after booting it off
:of the floppy, I got a dialogue box saying "Sorry PAL machines only".
:I then called up Electronic Arts in California, and they confirmed my
:suspicion that Populous II can run only on European machines, and no
:American version will be created.

This is very weird since the POPULOUS II package that I bought works fine on my non-PAL machine. I noticed that in the AUTO folder there was a program to make my monitor become a PAL monitor by making it run at 60 MHz. If the 60 MHz program isn't run, POPULOUS II won't run either.

:but I believe the phone rep. at Electronic Arts when he
:said that no Populous II exists for American Atari's, nor will there
:ever be.

I suspect what happened was that EA originally released POPULOUS II to the American market without the 60 MHz program in the AUTO folder. When they realized what they did wrong, they fixed the problem in later releases. I guess you bought an early version.

:Now I have to deal with a major problem (which I'll explain
:further in another post): I had to put the Populous game in the AUTO
:folder of my hard drive-- it boots up and crashes and I can't get
:access to my hard drive! Auughhh!

Just power up your ST while disabling the HD. Then when you get to the Desktop, run the HD boot program. It should bypass everything in the AUTO folder and you can delete POPULOUS II.

Hope this helps!

Well, on my TT (TOS-3.06), there are no trouble in running gem from
mint.
I tried to follow up on this subject once before, but the message got
corrupted on the way somehow... oh well.
Both chmeleon AND clipbrd acc runs just fine on my TT with mint 0.94, so
the trouble is probably somewhere else than with these utilities.

>
>How do you expand the memory..? Until the STe, you hacked and slashed,
>and prayed the mess would work when you were done. With the STe, you
>break the seal and void your warranty.
>
>With a PC you plug memory into the provided sockets.

This, of course, assumes that there are sufficient and appropriate sockets for your purposes.

Newer PCs tend to have some space for SIMMs, and can be fairly easily expanded to some limit (4 MB? 8MB? or is it 12?). Once you hit that limit, it's-a-gonna be a pain to expand it any further.

Older PCs tend NOT to have ANY space for SIMMs, and are gonna be a little tough to expand past 2MB (for more recent machines), 1MB (for just slightly older ones), 640K (for pretty well ANY 8088 based system), and 512K for some of the more ancient ones.

The ST methods are, admittedly, somewhat painful. I just saw a board in at my local dealer last week that might make it a little less painful - it's an add-in that puts a SIMM board into ANY of the older STs. Apparently it doesn't require soldering, except with a few obscure ST models.

Of course, the BIG difference is STILL the soft/firmware support for the expanded memory.

On PCs, there's at least 3 different "standards", including "Extended" memory, "Expanded" memory, and the new "Protected mode" memory.

People that enjoy throwing money at Microsoft can get software that will auto-configure their systems, so that Windows doesn't run quite as badly.

Programmers swear AT the standards, because they all make programming more complex, with no tangible benefits. (Complexity that actually ADDS functionality can be good. Having the 3 "special" types of memory, plus the variety of memory "models" only gives you choices that you don't want to bother making.)

Memory segments are useful if you want to run virtual memory, and can swap virtual memory in and out, a segment at a time. When you're just trying to write an in-memory program, it's a PAIN.

To cut the talk short (too late!), there IS a contrast between the IBM
and the Atari (or the IBM and the Mac, or the IBM and the Amiga).

Contrast:
IBM RAM: Easy to plug in.
Atari RAM: Somewhat painful to install

IBM RAM: Requires additional software support (KLUDGES!) in order to
take any advantage of the extra RAM.
Atari RAM: Once it's there, it's available. Anywhere, any time...

Intel: They want to have THREE classes of memory: First class,
second class, and unavailable...

>(Mindless Atari Cheerleader comments like we've been hearing can be
>directed to device/null...)

That's MISTER /dev/null to you!

Well, on my TT (TOS-3.06) gem runs just fine from mint in the auto-folder.
Also, both chmeleon and cliboard accesories work, so I guess the trouble
lies somewhere else than in these utilites.
Oh yeah, I also use mint-0.94.
The trouble might be (as you suggest) that GEM doesn't have it's environment
set correctly.

Source record: 222083

Don't flame me netter, I'm an amiga user who uses an Atari ST emulator for a couple of programs which are unavailable to the Amiga. The one I use the most is Soft-Logik's PageStream Font Editor which I found recently at the terminator FTP site. It was version 0.8 and I was wondering if a more recent version of the program is available? Also the emulator I am running does TOS v1.2A, I am wondering if you need a new emulator to emulate new TOS or can I just upgrade system software. If this is the case, I'd be willing to buy recent system software w/ manual if anybody is selling. Also wanted is a font editor which will save Adobe Type 1 (binary) fonts.

Thanks in advance

David Paschall-Zimbel writes, with his typical flair for distortion:

>>With a PC you plug memory into the provided sockets.

>And THEN you mess around trying to find the proper system software to allow
>to USE the memory (Expanded memory? Extended memory?) which you have install

Gosh, David.. I've never had a problem setting up memory on a pc.. of course it requires the ability to read and follow the directions.

I'd rather have to worry a little about setting up extended memory than having to worry if my applications are going to crash because the kludgy "memory upgrade" board that is "installed" by ramming little pins down over my MMU chip is going to wiggle, or destroy the MMU socket. Having to open the computer every few weeks or days and push all the chips and kludgy connectors back down is a lot less fun than setting up EMS or XMS just ONCE.

>>With a PC you just plug a new graphics card into a slot.

>And THEN you mess around, cursing yourself if you bought the wrong graphics
>card for the application. Or you purchase yet-another-graphics-card. (This
>is, of course, getting less complicated with the 'standardization' of Super
>VGA, but then again, graphics cards for the Mega-series are easily
>plug-and-play as well...)

Again, a little ability to read and understand your application helps.. or are you saying you're not capable of choosing a compatible card for the programs you want to run. Finding a PC users group might be a good idea in that case.. they could help.

Gee, David. You have a source for graphics cards for the Mega-series? Why don't you let the ST world in on your secret? Of course, they only cost $79 for 1024 x 768 x 256 colors, right? And they don't fill up your ONLY "expansion slot" so you can't use anything else in your computer?

>>With a PC you just plug a new controller card ($29) into a slot and swap
>>out the drive ($49).

>Gee, Bob. You have a source for 1.4 meg floppy drives for only $49?!? Why
>don't you let the ST world in on your secret so that we can lower the cost f
>the folks who have been installing 1.4 meg floppy drives on ST equipment for
>the past year or so.

Sure, David. My big secret is called "Computer Shopper". Of course you need to be able to read with a little comprehension to be able to make use of it. Also there are what are called "computer swap shows" where dealers sell lots of nice things like $49 1.44 Meg floppy drives, and $299 CD-ROM drives, but for some reason (lack of interest perhaps?) they

don't have them every other weekend for Atari computers like they do for IBM stuff.

>>With a PC you just plug a soundboard (Thunderboard $89) into a slot.

>Bob fails to mention that, with the STe, you don't NEED to spend an addition
>$89 to get great stereo sound. Of course, you could always purchase one of
>stereo cartridges, such as ST Replay and its successors.

What David fails to mention is that all of these are virtually unsupported by software. There are a few games that take advantage of the STe sound, and a few Amiga MOD players that might work with ST Replay, but beyond playing a few demo samples, there's virtually zippo you can do with them.

With a PC you're not stuck with the yucko Yamaha sound chip, you have a choice of upgrades. And virtually ALL new software (now THERE'S a concept.. imagine NEW software for a computer coming out daily..!) supports the sound boards.

>(Directed hatred for all things Atari like we've been hearing from Bob SHOUL
>be directed to /dev/null...)

Gosh David, what a creative mind..! Remind me, if you would, when exactly did I say I hated all things Atari..? Having an open mind is a great deal different from having a closed, slanted one like you seem to keep displaying.

If you'd learn to read, the letters on the screen, instead of filling the empty space between the lines with what you want to see, you'd be able to figure out that I didn't start this discussion. I'm simply answering a topic that was previously brought up, and trying to level out a little of the inaccuracies that always seem to creep in when Atari zealots get a little defensive...

(I was reading a DEC journal today at work, and one of the illustrations in an ad was priceless... it made me think of all the Atari cheerleaders I've ever "met".. it was a full color illustration of an ostrich with its head firmly planted in the sand.)

You're a good little Atarian, David.. .even though you seem to have wandered into something that wasn't directed at you, but seem to take it personally nonetheless..

I've always thought the line-by-line refutation of a previous article was a little silly and a waste of precious "bandwidth", so I won't bother replying to that one. Besides, my hands are cold from riding home from work, and I still have to check in on CompuServe again to see if anyone over there needs any help.

Keep up the good work, keep that mind locked tightly closed, and keep on reading messages as "creatively" as ever.

Carl Kreider asked:

>While today's PC clone is certainly more open and expandable than an
>old ST, why should you (given your postion) argue the case? Why does
>it offend you that some poor soul wants to believe in ST expandability?

Ah... a very sensible question..!

The problem is, I have to deal with a lot of people who have either just gotten an ST, are considering buying one, or have just gotten the one they bought back in 1986 out of the closet, and they want more memory than what came in the machine.

When someone tells them that the ST is an "open archeticture" machine, or that there are "dozens" of memory upgrade boards to choose from, I consider that a disservice to that Atari owner.

Also, when this new Atari owner buys one of these wonderful "solderless" expansion boards, thinking they'll just plug it in like on a PC, the odds are very likely that I'll end up trying to talk them through fixing it, or helping them make it work as well as it can.

It might be great if they could just "believe in ST expandability" but when it comes to actually applying that in practical terms, they're likely to be disapointed. I believe in telling them up front about the pitfalls they're likely to encounter, rather than having to help them clean up the mess.

In a lot of cases, I'll recommend that they actually sell their 520 or 1040 and buy a new STe, with its far easier memory upgradability.

In NO case have I ever recommended that anyone sell their ST and buy a PC...

However, if they're still looking for a computer, and their stated goals and intended uses indicate that they need a machine which can be easily upgraded in the future, I WILL steer them away from anything earlier than an STe, and often WILL recommend a PC, especially if it sounds like they'll need software and support which just isn't available in the Atari market.

Also... I don't consider anything I might have said to be "Mindless DOS Cheerleader comments". I have both kinds of systems (ST and PC), and am very familiar with the strengths and weaknesses of both. (You will NEVER see me make a comment about Macintosh, as I have neither the machine, nor any experience with one.. same goes for Amiga, NeXT, Sun, etc.)

When I see a question asked, I'll give an honest answer, even if it might not put the Atari in the best light.

An example: Your question about how the memory of the earliest PCs was expanded... you simply inserted a memory expansion card into one of the multiple, provided slots. With the earliest (and later) STs, you hacked, and slashed, and soldered chips on top of chips, or pushed pins down on top of socketed LSI chips which either ruined their sockets or made the operation of the computer questionable. Atari DID NOT design their computers to be expanded, and MANY times made statements to the effect that they did not recommend ANY memory expansion products be added to any of their computers.

5308. Pascal compilers for ST, programs for sale/trade

Newsgroup: comp.sys.atari.st
Date: 1992-05-21 05:49:15 UTC
From: cdowns@eve.wright.edu
Message-ID: <1992May21.014852.10383@eve.wright.edu>
Source record: 221933

I'm fairly new to the ST (since last November), but I still haven't found a Pascal compiler (one is listed on the umich archive, but I've been told it doesn't work). I'm most familiar with Turbo Pascal on the IBM. I do have Laser C for the ST and I suppose I could hunt up a C compiler for the IBM, but most of my school courses seem to use Pascal (and I'd have to relearn C). What I am looking for is a Pascal compiler that I could just compile the code written on the IBM (almost entirely non-graphic, standard Pascal) and use the programs on my ST. Please help me and you may soon see the fruits of my labor on the umich archive (I'm a CS major and love writing simulations).

Also, I've got some stuff to sell that I either never use or don't have time to learn how (or don't have the time to play some of the longer games). Make me an offer (money or trade : hint - I'm looking for Risk or Sim City or GOOD graphics adventure {either shoot'em up or strategy, just something that doesn't take days or weeks to play}).

The Pawn, Swiftar, Hitchhikers Guide to the Galaxy, Dungeon Master, Mindwheel, StarGlider, Mindshadow, Hacker, Sundog, Ultima II, maybe one or two others I can't remember now. (Leather Goddesses of Phobos).

5312. JPEG on the st

Newsgroup: comp.sys.atari.st
Date: 1992-05-21 10:30:38 UTC
From: shore@yonder.equinox.gen.nz
Message-ID: <H.s&2Z3WGHN46@yonder.equinox.gen.nz>
Source record: 221925

Everyone's asking about JPEG for the ST here, and noone seems to have
mentioned that there are programs for them on a.a !!
Well at least this article i'm about to quote from says so... I don't yet
have access to a.a :-(

This is quoted from the FAQ file of alt.binaries.pictures

IV. PORTABLE UTILITIES

"GENERAL UTILITY" TOOLS:
GIFtest.c Tests integrity of GIF files.
>> Available via anonymous FTP from BONGO:gifutils/giftest.c.

COMPRESSION/DECOMPRESSION TOOLS:
cjpeg/djpeg Free, portable C code for JPEG compression from the
Independent JPEG Group, lead by Tom Lane
(tgl+@cs.cmu.edu). This software has been tested on
numerous Unix machines, PCs, Macs, and Amigas; it is
believed that it can be ported to almost any machine
that has a (reasonable) C compiler.
Available via anonymous FTP from several places. The "official"
>> archive site for this source code is ftp.uu.net (137.39.1.9 or
>> 192.48.96.9). Look under directory /graphics/jpeg; the file to
retrieve is jpegsrc.v?.tar.Z. You can retrieve this file by FTP or
UUCP. Folks in Europe may find it easier to FTP from nic.funet.fi
(see directory /pub/graphics/programs/jpeg). The source code is also
available on CompuServe, in the GRAPHSUPPORT forum (GO PICS), library
10, as jpsrc*.zip.
If you are not reasonably handy at configuring and installing portable
C programs, you may have some difficulty installing the free source
code. There is currently an FTP archive of pre-built executable
versions of the free JPEG code for various machines, accessible at
ftp.cis.ksu.edu (129.130.10.80); look under /pub/JPEG to see what is
currently available. The administrators ask that FTP traffic to this
system be limited to non-prime hours.

CONVERSION TOOLS:
PBMPlus tool kit Maintained by Jef Poskanzer (jef@well.sf.ca.us). Very
nearly a de-facto standard for converting between many
different formats. Includes "utility" tools to scale,
quantize, crop, flip, rotate, and many other graphics
operations.
>> Available via anonymous FTP from EXPORT:pbmplus*.tar.Z and from
ftp.ee.lbl.gov (128.3.112.20) as /pbmplus*.tar.Z. Visit the newsgroup
alt.graphics.pixutils for more details, discussion of usage, etc.

GIFtoPS GIF to postscript converter.
>> Available via anonymous FTP from BONGO:gifutils/giftops.c.

[.....]

VIII. Atari UTILITIES

[J-NOTE: There is a wonderful archive of Atari tools available either via anonymous FTP (on atari.archive.umich.edu - 141.211.164.8) or via e-mail, by sending a one-line mail command message. Many of the utilities listed in this section can be obtained here; these will be identified by the notation "ATARI-ARCHIVE: <archive-file>".
This would mean that you could get that utility in the pathname specified as <archive-file>, or via e-mail by sending a one-line e-mail message containing "send <archive-file>" to atari@atari.archive.umich.edu.
I might also suggest to fellow Atari-ites (Atarions?) that you get a copy of the index (one-line e-mail message is "index") and help (one-line e-mail message is "help") for this site - there's all *sorts* of good stuff out there!]

COMPRESSION/DECOMPRESSION TOOLS:
cjpeg/djpeg (See description under "COMPRESSION/DECOMPRESSION TOOLS" in the "PORTABLE UTILITIES" section above)
Atari-specific executables are available from your friendly neighborhood ATARI-ARCHIVE: graphics/jpeg1bin.lzh.

CONVERSION TOOLS:
dmjgif Converts GIFs to Spectrums. Excellent - many options.
Slow (unless you register!) but effective. [Shareware]
ATARI-ARCHIVE: graphics/dmjgif3.lzh.
GIFSpec Converts from GIF to Spectrum format.
ATARI-ARCHIVE: graphics/gifspc.arc.
PBMPlus tool kit (See description under "CONVERSION TOOLS" in the "PORTABLE UTILITIES" section above)
Atari-specific executables are available from your friendly neighborhood ATARI-ARCHIVE: printing/pbm/pbm-readme (The file that explains it all)
printing/pbm/pbm-man.zoo (man pages)
printing/pbm/pbm-bin.zoo (Portable bitmap binaries)
printing/pbm/ppm-bin.zoo (Portable pixel map binaries)
printing/pbm/pgm-bin.zoo (Portable grey map binaries)
printing/pbm/pnm-bin.zoo (Portable any map binaries)
SpecDec Converts from Spectrum to Degas format.
ATARI-ARCHIVE: misc/specdeg.lzh.

PICTURE VIEWERS:
giffer Monochrome GIF viewer (4 dithering options).
ATARI-ARCHIVE: graphics/giffer.arc.
gifshw2 Color GIF single or "slide-show" viewer.
ATARI-ARCHIVE: graphics/gifshw2.arc.

mgif Monochrome GIF viewer.
ATARI-ARCHIVE: graphics/mgif37b.arc.
quickgif GIF "slide-show" viewer. Very fast and good results.
ATARI-ARCHIVE: graphics/quickgif.lzh.
SPShow Spectrum file viewer.
ATARI-ARCHIVE: graphics/specshow.arc
SPSlide Spectrum file "slide-show" viewer.
ATARI-ARCHIVE: graphics/spslidex.arc
viewgf Image viewer (many formats, including GIFs) - good.
ATARI-ARCHIVE: graphics/viewgf12.lzh.

Consult the comp.binaries.atari.st, comp.sources.atari.st or comp.sys.atari.st
news groups for Atari-specific information.

I hope that's of some use to someone!!

Craig.

Hi,

I am thinking of getting MultiTeX 5.xx for my machine, which is supposed
to be able to run under MutliTos via multitasking.

I was wondering if MinT would have the same effect, since most
tex-progs. (previewer, tex, printprog) are tos progs, if I`d be able
to work multitasking like with this combination.

Anyone who has made any experiences with this ?

Yeah, i'll have to agree with you about them being pretty good.
I ordered my HD from them, and the service was good, which is
supposedly unusual when ordering stuff from overseas to here in
New Zealand. I did strike the usual thing of them having never
heard of NZ & not knowing where in the world it was, but their
local post office did :-)

>
> I for one appreciate Questor's pace of development. Don't get the
>latest and greatest if you don't have to. Stick with 2.01h or i.
>You'll be fine.

A new one that seems to be excellent is the ARJ format.
On a PC it's slower than ZIP, because it uses floating point arithemetic(sp?)
but it's Ok on the ST etc using the 68000 chip.

At the moment there's only an UNARJ program that I have got/ know of
written by Jorge Cwik (called STUNARJ.TTP).
I'd love to get my hands on a program that will compress them as well :-)

The speed is excellent & so is the compression, here's the results of
a small test I did...

The test was on : 34 files, 231065 bytes uncompressed

Method Size compressed Time to decompress
LZH 109900 38.5 sec
LZH v5 88268 43.9
ARC 129045 39.5
ZIP 110628 25.2
ZOO 89462 40.7
ARJ 87812 26.4

And you can see from that, ARJ is by far the winner, it's only 1 second
slower than the fastest which was ZIP (which is the second worst
compression), and it's the top compression.

>(void *) where prohibited by law

I've already tried unpacking the files separately... that's how I determined that JAS.TTP was not there. I'm not at all sure how this could have happened. The first time I tried to install 1.33 was when it first appeared on terminator. At that time, I was unsuccessfull (same symptoms), but I had assumed that I got a bad download (I use BART to get everything from terminator). I decided to wait a few weeks, and try again, figuring that someone may have just put a bad copy out there.

My latest attempt (the one which prompted this posting in the first place) failed with the same results ... no JAS.TTP (Other things may be missing, I'm not sure... install.doc lists a directory map, but does not include a complete listing of the contents of the \bin directory). Now, bear in mind several factors common to all my attempts: the file I get from terminator is always sozo133i.zoo; I always use BART to get it (although I've never had any other problem with BART); I'm not perfect, but I do know ATARI STs inside and out. My gut feeling is that the .zoo file at terminator is defective.--

>concept.. imagine NEW software for a computer coming out daily..!)
>supports the sound boards.

In this part of the discussion, the comparisons that are made are
especially inappropriate.
On the one hand, there are the sound capabilities that are built
into the computer systems in question. Here, the ST is clearly
better than the PC with its beeper.
On the other hand, there is the expandability of sound
capabilities. Here, there seems to be a lot available for the ST,
and they are supported by some software. NoiseTracker and the
Meinolf Schneider games are examples. For the PC, there are slot
card solution abailable, Soundblaster seems to be some kind of
standard over here.
Please don't compare the innate capabilities of a system to the
expanded ones of the other one to "win" an argument.

[whole bunch of anti-Atari cheerleading deleted]

I was desperately trying to stay out of this, but couldn't. <Big sigh!>

I have a 25Mhz, 386DX w/4 Mb, NEC 3D plugged into a VGA card (and a bunch of other stuff) at work. I have DR DOS 6.0 (one of the better versions of DOS, IMHO). I have been using computers for a long time (owned one of the original IBM PCs). I would much rather "expand" an ST then deal with setups and configurations on PCs.

There is conventional memory, high memory area, upper memory block, expanded memory, extended memory, (and of course the various convolutions depending on the driver emulations). Pardon me, but this is f***ing nonsense for a "user" to have to deal with. Most of the damn PC programs want to run in conventional memory, some will use expanded, some will use extended and some will barf if there is memory mapped into the video area. And very few of the documentation for these program will tell you which type/kind/amount is required. It is trial and error, trial and sometimes works, trial and error, trial and possible success. And then you get a "new" program and start all over again. If this defines an "open" architecture, you are welcome to it. I will stick with "closed by Atari"!

And take the Soundblaster card (very popular in the PC world) - for not much more than the cost of that, you can buy a whole 1 Mb STE computer. And just how many PC programs (other than some games ;-) make use of that card? (Sorry, couldn't resist). PCs have to be "open" because you don't get sh** with the computer and you have to buy just about everything to make the damn thing useful. (And yes, I am aware that this is changing - but so is Atari.)

>(I was reading a DEC journal today at work, and one of the illustrations

>
>BobR

This is a great quote. But I'll let you in on a little secret: This is exactly how most of us out here in Atari land view your position. You obviously have had some major gripe with Atari that you just as obviously cannot get over. Please give it a rest. Why don't you go check up on Richard Covert and see what he is up to for awhile. :-)

> heard about the Sparrow ? (ie the machine that's between the
> 1040st & the Falcon)
>
>Kym

I haven't heard anything about it.

I kind of hope that there is no Sparrow and that the Falcon 030 at 16 MHz in a 1040 style case is the low-end computer that Atari will be selling.

It would be a shock if Atari would introduce another computer for $300 that isn't nearly as powerful.

Heck, in another year, the Falcon 030 will seem like nothing to us...

Len

P.S. maybe Sparrow = Jaguar?

Could someone please email me (or tell me where to ftp it)
zoo version 2.00 please. I want this specific version because I have
a .zoo file which was created by zoo2.00 and zoo2.1 will not unpack it.
(I had unpacked that file several times with my old version of zoo, which I
recently deleted when I got zoo2.1.)
The .zoo file doesn't seem to be corrupted according to fiz.

Uh, folks, aren't you getting on Bob's case a little here? This thread started last week, not because of anyone's insecurity, but because an implication was made that PC's aren't worth their weight in dog poop. Some Atari users here (many of whom have been in the community for a number of years) disputed that general claim on some at least vaguely factual grounds. It didn't start out religious, and I don't think Bob was trying to make it moreso; it's just that any time Bob ever says anything even slightly negative about Atari now he get slammed for it because he's been overwhelmingly negative in the past. Maybe Bob is more cynical than most, but does that mean you should ignore anything he says out of hand?

From: Glenn Rowe <growe@dund.mcs>

Remember you volunteered to post something for me on the Atari network
about emacs. If you could post the following note, I'd be most grateful...

I've had emacs (version 18.55.12) running on my STE for quite a while,
but there are several things that I cannot get to work...

1. Commands that call up system commands, such as M-x compile. The error
message is: Symbol's function definition is void: start-process. I realize
that TOS doesn't allow multi-tasking, but emacs could suspend itself while
running compile. gnumake presumably does this, and it runs fine on the STE.

2. Getting emacs to read an initialization file. On a Unix system, you
can put a file called .emacs in your home directory which emacs reads on
startup, doing stuff like initializing key bindings, abbreviations,etc.
Any idea how to do this on the ST?

3. When I run emacs on a file in directory c: (the default directory on
the hard drive) emacs complains that the file isn't found and the
directory doesn't exist, though it works fine in other directories.

Please send replies to growe@uk.ac.dund.mcs

This is't directed at Roy or anyone in particular.

I'm a user. That's how I define the level of computer knowledge I think
I have. (perhaps you could make that Professional user *grin*)

As a user, the ST is GREAT! Also, as a user, the PC is horrid!
I can't peronally understand why anyone would move from the GEM of the ST
to the cli of the PC. I can understand it for 8bit owners, but not from
ST owners. Our non-Atari machine is a mac. And, if you haven't noticed,
MAC prices have come down quite a bit, making the lowend-starter machines
very affordable compared to PC machines.

I see no proft in comparing STs to PCs. I think talking about STs and
Macs makes more sense. Anyway I look at it, PCs are yeeck! *grin*

When I ran into this problem, I assumed it to be caused by running out
of memory -- I only had 2 Meg. Isn't 4 Meg pretty much a requirement
for compiling large programs? I know I can do small programs, but large
ones didn't seem to like GCC.

>
>As a user, the ST is GREAT! Also, as a user, the PC is horrid!

The ST is great provided you will stay happy with the way you can use it *now* forever. That's been a main point all along: if you decide you'd like to upgrade your 520ST to handle some new application you never thought about before (random example: 1024x768x256 raytracing), you're out of luck. If you're a PC owner you'll generally just have to put in a new card. At the worst you can replace the motherboard and at least keep the power supply, drives, etc. intact.

Many people CAN stay happy with what they have forever. Or at least they think so now, after owning their Atari's for several years. I make no judgement on that; I'm only pointing out that when you buy an inherently closed system, you're making a concious decision -- i.e., that you'll be happy with what's in the box *forever*. Either that, or you'll be buying a whole new system a few years down the road.

>I can't peronally understand why anyone would move from the GEM of the ST
>to the cli of the PC.

You might want to get to know more people, since I personally know three fairly vocal people just in this group that much prefer a command line interface to GEM. Even if you can't understand why (your own words), you should at least accept the fact that such people exist and are not (totally) insane. It is exactly this mentality of "I would never want to do this, so therefore no users will" that has lead Atari to create closed systems in the first place. And I believe that the ST's closed nature has been its downfall, despite all the other bad things that have happened in the Atari computer. A computer that cannot be expanded to keep up with competing hardware is doomed to fall by the wayside. The argument that people are happy with what does the job only goes so far: you don't see many people writing papers with 1928 mechanical Underwoods, even though they will "do the job" adequately. It's not just a matter of "users like the latest gadgets;" it's a matter of "better technology = more convenience."

Besides that, using a PC does not imply using a CLI for anything but trivial operations. (Like changing directories.) I'd venture to guess that most users tend to spend the vast majority of their time in a small set of applications: Word Perfect, Paradox, Lotus, etc. These people hardly ever use the CLI anyway. And if they're so darn scared of typing commands (some people are), they can use Windows. (Yes, it's not the best, but then again I don't have much respect for GEM either.)

>I can understand it for 8bit owners, but not from ST owners.

The implication being that ST owners are more enlightened to the Ways of WIMP interfaces (WOW) than their more ignorant 8-bit comrades? I thought the idea was that a good machine will suit you fine forever; then why aren't all the proponents of the ST's closed architecture using 8-bits? My Atari 800 was Just Fine for editing documents, doing taxes, writing programs, etc. This same argument against the ST (because the ST, being non-upgradeable, is forever stationay in the technology continuum) will become steadily more and more compelling.

I hope these don't seem like emotional or religious arguments. I have no interest in seeing Atari go Chapter 11 (bankrupt), and a similar lack of interest in seeing PC clones increase their already ridiculous market share. But the sad fact remains that systems that are not easily upgradeable are destined for the computer junkyard. It only takes a brief trip through a 1984 issue of Byte to see how true that is.

>And, if you haven't noticed, MAC prices have come down quite a bit,
>making the lowend-starter machines very affordable compared to PC
>machines.

Hmmm.

>I see no proft in comparing STs to PCs.

If Atari doesn't take a good look at history, they are doomed to repeat it. (That has a nice ring; maybe I should write it down.) :-)

[In article <53333@ncratl.AtlantaGA.NCR.COM>,
cscullio@ncratl.AtlantaGA.NCR.COM (Chris Scullion) writes ...]

> I've already tried unpacking the files separately... that's how I determined
> that JAS.TTP was not there. I'm not at all sure how this could have happened.

Try again, but check the following information to ensure that your version
is not corrupted.

First of all, you should have a file named SOZO133I.ZOO that is
366,320 bytes long. A verbose ZOO listing should look like this:

```
Length CF Size Now Date Time
-------- --- -------- --------- --------
28661 51% 14091 28 Jun 91 02:44:28+1 gemenv.prg
31042 65% 10854 5 Dec 91 14:44:12+1 install.doc
23032 54% 10623 4 Dec 91 20:44:14+1 install.prg
188463 1% 187195 5 Dec 91 15:08:00+1 scbin133.pdf
119447 0% 119163 5 Dec 91 15:08:02+1 scdoc133.pdf
24725 4% 23858 5 Dec 91 15:08:04+1 scxmp133.pdf
-------- --- -------- --------- --------
415370 12% 365784 6 files
```

The important file in there for your purposes is SCBIN133.PDF, which, as
you can see, is 188,463 bytes long. It is a self-extracting LZH archive,
which means it will try to unpack itself if you run it as a program.
However, you also can use LHARC as a tool to operate on this archive. If
you run LHARC -v on the file, you should get the following list:

```
LHarc 2.01g (c)Yoshi, Quester, 1988-91.(Assemblerversion vom 07.10.1991)

Listing of archive : 'SCBIN133.PDF'

Note that the entry for \SOZOBON\BIN\JAS.TTP is there, and accounts for a file of 33,711 bytes packed down to 16,645.

If your files match these specifications, then INSTALL should be able to unpack everything *if* you have enough memory and disk space. As Ian mentioned, the LHZ self-unpacker isn't very smart, and if it encounters a problem, it may simply abort without explaining the situation. If you are short on memory, you might try using LHARC to unpack the archive.

If, after all this, you still have a problem, then I'd start worrying about hardware, and I'd begin with a memory test.

Maybe it's just the same problem I had one week ago:

I had misplaced a trailing backslash at the end of the env-var TEMP and
that caused strange error-messages in obviously correct header-files. After
deleting the backslash everything worked fine.

I had a similar problem with gcc 1.40, indecipherable parse errors
in include files, and found that it was my Gulam environment variable
TEMP that it didn't like! The distributed example Gulam scripts give
TEMP with a trailing backslash, like

setenv TEMP g:\

this confuses gcc mightily, try

setenv TEMP g:

I've had no trouble with this game, ONCE I found the 60-Hz Loader
(supplied with the disk) that should go into your AUTO folder. With
a boot manager, I have no trouble switch in and out AUTO folder
programs and accessories.

NOTE that you may have to adjust the Horizontal and other assorted knobs
on your monitor to accomedate the 60-Hz loader. Looking at a bright
screen with the loader installed for too long may cause eye strain and
fatigue. Populous II wisely choose deep soft colours so that eye strain
is at a minimum.

I have a plain vanilla 520STfm, with and early version of TOS.
(I can't remember the exact number). What is the newest version
of TOS I can get for my machine. I hear people talking about 1.6
and 1.4, but I'm not sure what the difference is (one runs on
TT/STE's only?) Can anyone offer any suggestions? Also, what
price are we talking about for a new upgrade (Any currency).
Where can I get the upgrade kit?

I downloaded and tried Alan Horihane's TapeBIOS driver for the ST today. It works great and was very easy to install. His gnutar port is equally wonderful. It gave me reason to download and install MiNT. Now I can tar a directory to tape while still using vi or whatever. Alan also includes 'includes' and libraries making it easy to use the tape drive in one's own programs.

Alan includes a list of tested drives with the package and asks for information on others. I don't know what kind of tape drive I have-- I just know that it is a 60Meg drive along with a 160 Meg hard drive in a Sun 3 shoebox. It all works perfectly off my ICD adaptor.

I recommend that anyone who needs tape backup check this out.

> opinion on Rising Star [a mailorder ST outfit]

They ripped me off, I'll never deal with them again. They had an ad in
ST Informer for GFA Basic for $89 + s&h. I called them to order, confirmed
the $89+ price, and placed the order. When it came, I had been billed
for $105 + s&h. I called and complained and demanded a refund of the
overcharge, they refused. I had paid by debit card (not credit card),
so I wasn't able to do a chargeback on them, I just got screwed out of
$16 in what must be a totally illegal marketing practice in any state.

DON'T EVER BUY ANYTHING FROM RISING STAR MAIL ORDER!!!

> PATH= and GEM locating RSC files

I pointed out here recently that TOS 1.0's GEM likes to see the PATH
variable stored as "PATH=\0data;data;data\0". Someone mentioned a very
good idea to me in mail: TOS 1.0 is sort of hard-coded to skip the char
right after the '=' (thinking it's \0), so you can put a path delim there
and fool it. Try setting PATH=;c:\whatever;d:\whatever; That is, put
a semicolon right after the '=' and see if that helps. Should work.

> Bad (crashy) program in C:\AUTO, what to do?

Simple: Boot from a floppy with your hard disk powered down. Once
you get the desktop, turn on your hard disk, and then double-click on
your hard disk driver from a floppy (SUPBOOT, AHDI, whatever). Now
you have HD access after the machine is booted, and you can do an
Install Disk Drive from the desktop options menu to install an icon for
the C drive, then you can just open the icon and delete the bad program.

I don't really like the way this thread is heading (a bit too
personal), so I thought I might add something that I hope can
calm some of the hard feelings. I just hope everyone understands
what I'm getting at! :-)

There's a Swedish saying that goes like this:
"Det finns inget daaligt vaeder - bara daaliga klaeder!"
If you translate that to (bad) English you get:
"There isn't any bad weather - just bad clothes!"

BTW, I might not be, as Dave Baggett says, "fairly vocal", but you
can add me to the (3 names long) list of users that prefer a CLI
over the standard WIMP-system that Atari uses. However, I think
the best solution is a mixture of the two (MultiTOS with MW2 is
a _brilliant_ example :-)!

>Gosh, David.. I've never had a problem setting up memory on a pc.. of course
>it requires the ability to read and follow the directions.

I didnt need to read directions to upgrade my STe to 4mb. I purchased 4 1mb
SIMMs chips. Opened the case (6 easy to spot screws). And verified the
polariaty of the SIMMs (but they only go in one way?) and turned the machine
on. I did not have to add anything to an arcane CONFIG.SYS or an AUTOEXEC.BAT.

Taken from an experienced users point of view. The time of installation on
both machines is approx five minutes. Boot the ST, and away we go! Boot the
PC, and first, change your CMOS settings, them maybe edit CONFIG.SYS, reboot.

Hmm, wonder whats the differnce?

Does it have customizeable key bindings? Customizeable colors?
(specifically the ability to reverse white/black to black/white)
Extension language?

I've been using TEMPUS some, which is probably a lot like this one,
and I've discovered a lot of limitations. It has a "friendly user
interface", with point & click, though.

I keep going back to MicroEmacs, which has everything you could want,
ways to extend it beyond that, and to boot it's completely free. :)
If I can't set it up the way *I* want it, forget it. Plus, it even
has a window-oriented feature. I tend to use the cli UNIX version more
though, from a MiNT shell.

Count me in too... One of the biggest reasons I like ST's over Macs is that
a CLI is not a standard part of the front end on the Mac. Although TOS doesn't
provide a CLI in ROM, the '.TOS mode', along with standard character
interfaces, makes it easy to provide one.

Interesting, the ST's, especially with MiNT and it's descendant, MultiTOS,
are quite close to Unix with windows...

UPP201@ibm.rhrz.uni-bonn.de (Michael Burschik) writes:

>Is there an emacs patched for eight bit ascii available for Ataris?
>If not, is anyone thinking of porting one?
> Cheers,
> Mike.

Actually there is.

Note that all paths directions may not be 100% accurate, as there are taken
from memory. Please bear with me.

There is the original port of emacs 18.57 which is found in the
/atari/gnustuff/tos/emacs/emacs1857 on atari.archive.umich.edu
This has some support for 8 bit chars, that is it can display them by setting
the appropriate variable to some value.

I have enhanced the emacs 18.57 by applying (how do you spell that ??) the
socalled gayle-patches, with gives more extensive support for 8 bit chars. In
addition to displaying (here we go again) 8 bit chars, there is also support
for sorting and displaying special translations of chars. More specifically the
last is supported by the ability to define a string to printed for a char, a
string with could be a pure ascii translation of a non-existant character or
could contain various escape-commands. Sorting of foreign char-sets is
supported by special tables describing how chars relate in terms of sorting,
case and such (never used it though).

On big advantage of the gayle-patches is that it enables you to use the ISO
8851 char codes for your favourite foreign character, rather than just have to
live with whatever value atari once decided it should have. This is of coourse
most significant if you must transfer you docs to other systems or programs.
For instance there is a LaTeX style that makes LaTeX support 8 bits char of the
ISO 8851 standard.

This port is located in /atari/editors/emacs-18.57 an atari.archive.umich.edu
There is also a version on the finish server funic.funet.fi

Source record: 221931

All the stuff you can read about picture showers or converters seems to be totally meaningless to me, since all I had with several programs were nothing but troubles. One program can't handle large gif's, the other can only convert gif's to jpeg's, but not other formats...

This brings me to the question if anyone can give me a hint where to find the official specification for these formats, since I cannot and don't want to pick it out of the programs. I'd like to experiment a bit and perhaps write a "perfect" program, so please mail me any tips.

5354. YACC & LEX for the ST

Newsgroup: comp.sys.atari.st
Date: 1992-05-22 10:09:16 UTC
From: miethe@speedy.ada.cci.de
Message-ID: <1111@speedy.ada.cci.de>
Source record: 221862

I'm looking for some PD tools like LEX and YACC are on Unix machines.
Someone told me there are some GNU tools, but I don't know which are
the ones I'm looking for. Any good ideas ?
A. Miethe (miethe@cci.de)

5355. **** WARNING TO AMERICANS ABOUT POPULOUS II ****

Newsgroup: comp.sys.atari.st

That is a simple fix. If you have TOS 1.4 or later:

1. Insert your hard disk boot disk (ICD or whatever) in drive A
2. Reboot the machine.
3. Watch the floppy light. As soon as it goes off press and hold Control, Shift, and Alternate.
4. Your computer will now boot off the floppy and (hopefully) install the hard disk driver. At this point you can access drive C and remove the offending program...

Sounds like you want C-LAB's Notator/Creator package. Fairly expensive, but it will do what you want, and much more. I'm sure someone heavy into midi on here can go into more detail...

>
Dave, very bad example. You can, at this very minute get exactly what
you're describing through Lexicore. Their package also does phong and
other shading, morphing and tweening, and is having drivers added for
every new graphic card entering the market. It has supported the ISAC
card for over a year, though some of the parts of the system have been
slow, appearantly due to subcontracters not meeting deadlines. Also
Lexicore seems to have had so sort of problem with their first distribution
arrangements. Lexicore's package also allows output in Renderman and other
high resolution graphics formats. It appears to be the best animation and
rendering package to hit the Atari market.
Also, I fail to see how replacing a motherboard is simpler than adding
a memory expansion board to an ST. Though there are some clunky memory
upgrade boards out there, I have heard of others, like the JRI simm upgrade
board, which are quite simple to install, and work reliably.

5360. BUG or feature ? in MiNTlib PL19

Newsgroup: comp.sys.atari.st
Date: 1992-05-22 12:15:47 UTC
From: woju@keep.fantasy.sub.org
Message-ID: <H.H56kg4uvL5M@keep.fantasy.sub.org>
Source record: 221934

```
Hi
===

I think I found a Bug (a minor one, but it looks like one) in the MiNT Libraries
PL 19. I encountered it while Porting a pathalias 1.3 (I know there are
enough of them on the net, but just for a test :-) ) I couldn't stop the
Program with pressing CTRL D or CTRL Z, CTRL C helped and aborted the
program. So I wote the following TEST.

main()
int buffer;

while(!feof(stdin)){
buffer=getchar();
printf("%d",buffer);
}
}
Normaly this should terminate with CTRL D ! What happened:
I got a printout of '-1' but the program was still running. While
pressing return the -1 was still there only after using SPACE or
other keys the printout got normal again (shouldn't have either, but
in normal conditions we wouldn't get there!). I took a look at
filbuf(fp) which is supposed to fill the buffer and set the flags.
But I found the EOF is not put into the flags. To judge from
the coment at the beginning of the file, it is supposed to be this way,
but I am wondering why this is so. How can a program terminate if
it continously checks for feof on stdinput which would run OK with
Pipes and filredirection, but not if I read from normal stdin, then
I get the EOF message but not with the feof call. I think this
should be changed. Or is this supposed to come thru a different channel ?
But FILBUF just uses the _read call (Which returns <=0 for error).
And this far my CTRL D EOF Message is prozessed, but afterwards it is
not regarded as a real EOF. tell me why this has to be this way,
or if this is really a bug.

THANKS!

Gruss
Wolfgang
PS: I am using Gcc 1.40 and the libs which come pure from the archive
(I made no changes so far) The same thing happens with MiNT 092

>>>>> Regarding Re: Can Atari read SPARC floppies? How 'bout the other way around?;
jensk@hpbbrd.bbn.hp.com (Jens Kilian) adds:

Jens> You need the `mtools' package for the Sparc (be sure not to get
Jens> an old version). With this, you can format, write & read IBM
Jens> (read: ST) compatible floppies on the SparcStation. I did this
Jens> last year, so I don't know what the latest version of mtools is,
Jens> or where to get it.

Let's see.... Mtools is up to VERSION "2.0.5" and it is dated "25 Aug 91".

I *strongly* advise users to use mtools and *not* Sun's dosmount/pcfs.
After using the latter, I've had trouble reading/updating such disks
under gulam on my Atari. When I switched back to mtools the problems
have disappeared.

The problem with mtools is if you abort some disk operation. It may
then mess up the FAT. I do not know how robust pcfs is on this point;
though I know that it is not perfect either in this respect.

5365. What is the best GIF viewer?

Newsgroup: comp.sys.atari.st
Date: 1992-05-22 13:42:32 UTC
From: mcmahan@cs.unca.edu
Message-ID: <1992May22.134232.27188@cs.unca.edu>
Source record: 221943

It seems that all of these have strong points, but none
can really do the job. Are there others?

: PICTURE VIEWERS:

: giffer Monochrome GIF viewer (4 dithering options).
: ATARI-ARCHIVE: graphics/giffer.arc.

For all its problems (especially not being able to recognize codes
in GIFs), this is the best. It can't swallow a lot of problems in
the GIFs, but otherwise it will show just about everything, including
GIFs that mgif says are too big for memory.

: gifshw2 Color GIF single or "slide-show" viewer.
: ATARI-ARCHIVE: graphics/gifshw2.arc.

This one can grok *anything*, but tends to crash more than anything
else. Re-boot type crashes.

: mgif Monochrome GIF viewer.
: ATARI-ARCHIVE: graphics/mgif37b.arc.

Bizarre command line interface -- I've never been able to
figure out how to do much. But it *refuses* to try anything that
it thinks there is not enough memory for.

: quickgif GIF "slide-show" viewer. Very fast and good results.
: ATARI-ARCHIVE: graphics/quickgif.lzh.

I think this is for color or something.

: viewgf Image viewer (many formats, including GIFs) - good.
: ATARI-ARCHIVE: graphics/viewgf12.lzh.

Great user interface! I wish mgif had it! This thing tries to
do too much, and as a result shortchanges each format. If it had
more image fiddling capacity and less conversion, it would be nicer.

Has anyone ported xv to the atari? *That's* a real GIF viewer!

Are there any other GIF viewers besides these that combine any of
the strengths each of these have? It seems each does one thing really well.

Scott

Message-ID: <1992May22.135333.2245@chinet.chi.il.us>
Source record: 221871

I'm having some mysterious problems which I suspect may be caused by a bad time setting somewhere (if I was sure, the problems wouldn't be mysterious, right?). In particular, under certain not-completely-defined circumstances, Mark Williams C bombs with a bus error when trying to compile a source file which compiles properly if I first run cc -E to do the include processing, and then compile the expanded file. Sure there are lots of other possible causes--I'm chasing after them too.

Anyway, the clocks that I'm aware of in a Mega 4 ST are the GEMDOS clock, the keyboard clock, the host interface clock and the on-board clock. Four of them, two volatile and two battery-operated. I'd appreciate a summary of how one checks the various readings. My best information so far suggests checking the IKBD clock with Gettime(), the GEMDOS clock with Tgettime(), the host interface clock with a bit of custom code available from the host interface maker (in this case BMS), and ....and I have no idea how to read the Mega's on-board clock. Any advice?

Correct me please... but if "." is one of the elements (I make it first) in the path... you can leave the .rsc file with the program, and it'll find it. Or I suppose you could move 'em all... but when you trash a no-longer-used applicaion... you'd have to locate .rsc files not residing in the same directory as the program!

I've written a VERY small wrapper program for Populous II on the TT to fool
the game into thinking the machine is running in PAL mode. I don't know if
it will work on an ST, it should as it only changes the valuer of the
_palmode system variable and one bit in the video control register. If
anyone wants it I'll post it to here (it's ony a 20 line program).

Apple seems to be doing OK and a big fraction of their market is still
for closed computers (Classics, e.g.). I don't see Sun's closed SparcStaitions
in any danger either. The open Apple II line is on the way out though.

>adequately. It's not just a matter of "users like the latest gadgets;"

This may be because of the CLI. I have seen
surveys that indicate the average number of applications used by PC
owners in just over 1. For the Mac it is closer to 4. People don't
do surveys with atari owners.

Nino, Gadgets by Small is the lone distributor of the SST to the best of my knowledge. Deal with them directly. They only very recently began shipping the first units out the door so you may have a wait while they play catch up. Don't call them by voice (especially from Oz) as they are always very busy. Your best bet is to send your queries by FAX or via GEnie if you have a GEnie account (congrats to all Australians on recently getting GEnie available). From Australia, reach Gadget's FAX number by ringing 0011-1-303-791-0253. A competitor in the 68030 accelerator game is Jim Allen's Fast Technology at 0011-1-508-475-3810 (voice or fax). Remember however, that these accelerators aren't cheap as prices START at US$599. Like the old speed-pro once said:

"Speed costs money... how fast do you want to go?"

well, the doc's clearly states that it is greedy in terms of memory,
besides that it is superior in terms of quality, but an update wouldn't
be out of question.

>
..
..

> more image fiddling capacity and less conversion, it would be nicer.
>
> Has anyone ported xv to the atari? *That's* a real GIF viewer!
>

Well, the source code is ~2 Meg tarred, and it's not much OS-specific
in
there I believe. And really, Xv isn't a GIF viewer, I'd say xgif is a
GIF
viewer, as Xv has support of a lot of other formats.
(version 2.0 is capable of saving EPS Postscript too, and has a really
'sexy' interface).

Besides, what you really need on the ST is some good simulation of more
colours. This is what I miss the most. (Too bad I'm only good at
complaining........).

> Are there any other GIF viewers besides these that combine any of
> the strengths each of these have? It seems each does one thing really
well.
>

As I have said earlier, I would really prefer a colour version of Mgif,
of course the interface is kind of lousy, but it works well enough for

me.

Try GemView it's the best program I know on this subject,
It displays all kind of st formats and also unix,ibm,mac & amiga
formats.
Furthermore it CAN display JPEG pictures, though this feature is'nt even
documented.
I think its shareware.
It's probably on atari.archive.umich.edu and if not try some
german st ftp site (don't have a list ready, sorry).
Another great feature: The documentation is in ENGLISH!!

Try this one.....

Leon.

I do know about Lexicor's software, but how do I put one of those super graphics card in a 520 or 1040ST? I was really referring to the ST's that don't have slots when I said that ST's are "closed" and thus "unupgradeable." Mega's with slots are "open" (at least to some extent), and that is a Good Thing. Unfortunately, Mega ST's are in the minority. I'd venture that if Atari had released the Mega in 1985 instead of the 520 the Atari community wouldn't be in the dire straits it's now in, and we'd all be running SVGA graphics and FM synthesis sound cards in our ST's. If that were the case, I'd be a much happier camper, since I've written and co-written a truckload of software for the ST which is now effectively unmarketable due to an overwhelming (underwhelming) lack of (paying) users. (So if I have an emotional involvement in this discussion, it comes from my love of Atari computers, not my dislike of them.)

We can only hope Atari follows suit with the Falcon and makes it an open architecture.

> Also, I fail to see how replacing a motherboard is simpler than adding
>a memory expansion board to an ST.

Well I wasn't really talking about memory. The only reason you'd have to replace a PC's motherboard would be to run an entirely new chip (like the 586, when it's released) or to run the same chip at a substantially different clock rate. Most PC's will take 16-32 megs of SIMM's these days right on the board, and many vendors have cards that take their machines up to 64 megs.

With the advent of the 25/50 and 33/66 chips, there's even less need to replace motherboards, since the external timing stays the same even when you put in a faster CPU. I expect that we'll see things like 25/100 chips down the road that run at 4 times the external clock rate instead of new chips that require 100 Mhz motherboard timings since the "internal turbo" method is so much cheaper overall.

Lastly, you'd be surprised how easy it actually is to replace a PC motherboard. One virtue of the huge volume of PC sales is that almost every component in the canonical machine has been standardized. This makes "plug-and-play" hardware *almost* reality. (I said almost!) :-)

I can not guarantee this but try the following.
1 Turn everything off.
2 Turn on the computer with the ICD disk in the internal drive
3 When everything is loaded turn on the hard drive
4 Wait for it to run up to speed
5 Double click on ICDBOOT.PRG
6 Highlight a drive ICON and turn it into a C:
7 Open the drive ICON
8 Delete the file
9 Praise be to God :-)

I use ICD too and also have C; as the boot partition but the first time I
power on it still boots off of A: for some reason. If I hit reset it boots
off C: tho'

Source record: 221860

Thanks to all who helped me get my hard drive working! I downloaded ICDTOOLS.ARC from Atari.Archive using my master copy of ST-Talk, and got into my hard drive to remove the LOADER.PRG file out of my AUTO folder.

I also got Populous II to work, thanks to the advice of one of the many Populous II owners out there. When I originally loaded Pop.II, my screen went crazy. I removed the 60mhz.PRG file out of the AUTO folder, and tried again. The screen didn't go crazy, but Populous gave me an "Sorry PAL machine required" error and locked up.

The 60mhz program is required to run the program to make Pop.II think that it's on a 60mhz PAL machine. All I had to do was adjust the vertical knob on my SC 1224 monitor to fix the vertical hold, and the game runs perfectly!

The ICDBOOT program makes Populous II bomb out, so I can't load the game off of my hard drive-- I stick to my floppy drive to play the game now.

Thanks to all who helped me with the hard drive and getting Populous II working! It's a very, very good game that leaves Pop. I in the dirt! I'll give a review of it if anyone is interested!

Thanks again to all that gave advice,

Perry

>I have a plain vanilla 520STfm, with and early version of TOS.
>(I can't remember the exact number). What is the newest version
>of TOS I can get for my machine.

The latest version of TOS which you can obtain is TOS 2.05. This requires an special adapter board. The source of the board (complete with TOS 2.05 ROMs) in the United States is CodeHead Software. You should check with your local dealer (or ST Format/Atari ST User magazines) for ads and/or more information about a UK release.

The U.S. pricing for TOS 2.05 is around $140 (including adapter board). There are provision for you to keep your old ROMs and switch between TOS versions if you find software which doesn't run under TOS 2.05. I don't know how much stuff 'breaks' -- but you can assume that it will be similar to the things which don't work on the Mega STe or the TT.

TOS 2.05 incorporates the NewDesk Desktop. You can more easily use the new Atari Control Panel, programs can be represented by individualized icons, you can drop files onto an icon to launch a program.

TOS 1.6 (and 1.62) work with STe computers only. TOS 1.4 is the last "plug it in and go" ROM upgrade for regular ST computers (i.e. no adapter board is necessary). At a minimum, you should probably be running TOS 1.4 on a 520STFM, especially if you have a hard drive for your system.

Komments and pathnames are stored dynamically. Atari is not a comment but a
flag, this does not take a single byte because the place of the Machine-Name
was available (but not commented) in early versions.

```

You do not need to give the *.*. If it is left empty, LHarc will take all it can get 'm -r <archive>' will do the job. Extracting is much simpler, just give the name of the archiv 'archive' will do 'x -rm archive' (you can tell the desktop to call LHarc if any .lzh is started).

> ATARI-ARCHIVE: printing/pbm

Please tell me if you get those binaries to work. I tried:
giftoppm file.gif > file.ppm
ppmtogif file.ppm > result.gif

But i always get a result.gif sized 11 bytes or so, and says:
"corrupt input file" or something like that. I assume it's
- again - a matter of incompatibility of TOS & UN*X. UN*X
doesn't distinguish between text and binary mode, but TOS
does 8-(.

The TOS binaries of PBMplus seem to choke over the TOS line
delimiter \015\012, since they seem to expect the UN*X like
line delimiter \012.

I tried to recompile PBMplus, but i didn't get bash, gmake and
gcc work together. And tcsh is a bummer too.

And I won't spend a lot of time in porting lots of mega sized
sources to (ANSI) Turbo C, coz i'll expect a new PBMplus version
anytime. I can see that non-ANSI C users don't care about
prototypes, but it's a lot of work to port to ANSI C then ...

I don't need Mint to work with bash and gcc, or is the gnu c
environment really that stupid? That would eat a lot of memory
for nothing, and g++ is even much bigger ...

So what's the perfect program ? 8-)

I prefer small ttp's without any GUI. GUI are good for interactive tasks,
but conversion is usually not very fast on ST, i.e. to slow for interactive
mode. Another point is, you can get good free unix software like PBMplus or
cjpeg/djpeg and only have to port.

If you don't have a GUI you can create a batch file and let your computer
work over the night without any control.

But anyway, enough of this discussion. I'm about to finish my own and fast
giftospu converter, with a highest speed of about 3 minutes per conversion.
As i told you it has no GUI, no SPU display (eats many CPU cycles) and only
a ttp interface.

For your question I want to tell you:

Go get Dave Baggett's graphic file format description document from
atari.archive.umich.edu for ATARI ST file formats. i don't have a clue
where to get jpeg docs, but you can get sources from ftp.uu.net.
Maybe you can get GIF87a and GIF89a docs there too.

If you don't get gif docs, i can email those to you ...

>(E)ight (M)egabytes, (A)lways (C)ontinuously (S)wapping...
i know it this way:
Eight Megabytes And Continuously Swapping
or
Escape Meta Alternate Control Shift

Good luck, and keep the bit running.

I would say a GIF viewer has to be fast as a first restriction.
giffer.ttp is the fastest GIF viewer for high rez., but it has
some problems with GIF higher than 400 pixel. it just crashes
in FS dither mode.

The GIF viewer of choice in low rez is gifcolor.ttp. It is the
fastest viewer I know, even faster than giffer.ttp. It dithers
to 16 colors and lets you scroll through the picture.

All other GIF viewers are way slow. I'm not willing to wait a
long time and don't get the results saved. I would like a nice
and fast GIF to Spectrum converter, but there is nothing worth
to use IMHO.

Just my 0.02 worth,

In answer the request for Spectrum emulator, if I remember right, it's in the atari.archive.umich.edu under /atari/emulators subdirectory with file name something like spectrum.lzh. You should be able to ftp from there, they do check the host sites network number and compare to their table before it allows ftp. If you run into trouble then check the your network adminstrator for registration.
The other way is use archie server to check for other sites that have this file, if memory sever me right, there is at least one more site has it.

This shouldn't be too hard to find out. Take a JPEG on your Sun, then djpeg a copy.gif. Then download both copies. First try the copy.gif on Giffer. If it works, then try to use the Atari.ST djpeg. If the Atari's copy.gif doesn't work, the you know that it is the Atari port that is at fault. If the Sun copy doesn't work, then you know that it is just Giffer that is too picky.

< code involving feof(stdin) deleted >

Hmmm. I don't know if this is a bug or a feature; I'll have to check what ANSI specifies, and also what Unix does in practice. Be warned, though, that both dLibs and the "regular" gcc library most likely behave the same way, since all 3 have essentially the same stdio code.

Harbison & Steele don't specifically address the issue of feof on a terminal, but they do say:
"Note that even if there are no more characters in the stream to be read, feof will not signal end-of-file unless and until an attempt is made to read past the 'last' chracter. The function is normally used AFTER [my emphasis -- ers] an input operation has signaled a failure."

I take this to mean that it's better to test the value returned by getchar (looking for a -1) than to rely on feof. I will try to find out what ANSI specifies, and if necessary to correct mntlib.

>and incorporates Scott Bigham's patches for Sozobon 1.33i (thanks,
>Scott!). There are also miscellaneous bug fixes, including some
>very important fixes to osbind.h. (see my next message if you want
>details).

The Heat-n-Serve/Sozobon version is also at atari.archive, under the name
mnthlb20.zoo in either atari/mint or atari/new, depending on how soon you
look for it. You may have seen an announcement for version 19a; ignore it.
I released it about two days before Eric released version 20. If you actually
got the 19a release, replace it with this one.

Notable with version 20 is that the printf/scanf routines in libm1.a have
been merged into libm.a, so that you can once again include the floating
point library with just the `-f' flag.

Source record: 221696

<ahem> I agree that PC's are more easily expandable, but consider this:
There are some people who consider expandability to be less important than
speed or ease of use. The Atari ST (8mhz 68000) consistently outperforms
20mhz 286's 386SX's, and 386's. This is important to me because I am
getting a lot more speed out of a computer that I paid a lot less for.
PC prices are coming down, but so are ST prices. ST's are also consistently
less expensive. You have to pay many times more than you would for an ST
to get an IBM compatible with equivalent speed.
Further, as a programmer, it is important to me to have a programming
environment that lets me get the job done rather than forcing me do deal
with a lot of overhead just so I can communicate with my operatingsystem.
The Atari ST is BY FAR the easiest computer to program. Not only is the
microprocessor faster, but it's assembly language is much easier to use than
Intel assembly. The operating system(s) available for the IBM make it very
difficult to do just about anything. For example, on an IBM, to access an
RS-232 port from C, you need a set of libraries that MIGHT NOT work with
all RS-232 cards or modems, while on the ST, you just make simple OS calls.
I've dabbled a little in GEM programming, and it's really not all that
difficult, whereas Windows programming is horrid. A friend of mine showed
me a program that opens a window, and it was two pages long, while the
same thing under GEM is a couple of lines. All this is why ST programs, as
few as there are, are so much better than their IBM counterparts.... the
programmer spends less time contending with the system, and more time
making his program nice. This is especially evident in MIDI software.

Source record: 221875

I wouldn't recommend atari to a new computer shopper, but I disagree with some of the sweeping generalizations about the reasons for atari's lack of success.

I don't think it has much to do with expandibility and openess. Examples of expandibility offered here are always met with: "yea but is it supported?", which is different. It's rare to see atari users limited by the inability to add peripherals or memory to their computers. (Of course it's rare to see atari users at all.)

My guess is that the reason the ST hasn't flown (apart from the obvious (IBM's clout)) is atari's inactivity. Until the overpriced TT in 91, atari used the *same cpu for 6 years* and only doubled the clock on some models in 90. Meanwhile ibm/clones changed cpu 2 or 3 times and quadrupled the clock (similarly for macs). You can't win a race standing still.

(Why is it that shortly after IBM introduced the open PC with an Intel processor, all 3 home computers based on the superior 68000 were introduced with closed architecture? Coincidence?)

Werner

5402. Graphical GNU Chess available!

Newsgroup: comp.sys.atari.st
Date: 1992-05-23 08:44:55 UTC
From: warwick@cs.uq.oz.au
Message-ID: <8048@uqcspe.cs.uq.oz.au>
Source record: 221876

Jeff has put my graphical gnuchess port in the atari/games directory
on atari.archive.umich.edu, in the file graphgchess.zoo

It requires:

1 meg, colour, zoo 2.1

It's has it's own graphical 'game' flavoured interface, rather than
GEM, mainly because I wanted to test out my libraries. Oh, by the way,
both binaries and full sources are included (of course, it's GNU),
including the libraries. The library sources are only in development
stages, but they were working sufficiently to implement Chess.
(Sprites, double buffering, etc.)

Enjoy!

>(which is a 50 meg MicrOtyme ICD special), I have to boot off of the
>hard drive to load up the device drivers; I can't turn the hard drive
>off, boot my computer off of a floppy, and then access the hard drive
>to remove the file out of the auto folder as the Atari doesn't
>recognize the existance of the hard drive as it didn't exist at boot
>time.

I never had these problems, when I had to kick off some faulty
AUTO-folder-program. Try the following:
- boot up your ST from a floppy disk, with the HD switched off!
- switch on your HD
- load the device driver program (AHDI.PRG, ICDBOOT.PRG, ...) from
your floppy disk
- create an icon for partition 'C'
- remove the faulty prg from C:\AUTO
- reboot your machine from HD

To prevent such problems in future I recommend, you install one of
the AUTO-setup programs, like SUPERBOOT. These programs let you
choose which of the AUTO-prgs and ACCs should be installed.

>to work multitasking like with this combination.

you don't need a special version of TeX to use the multitasking
features of MiNT with TeX. With MiNT you can start every
TOS-application, including TEX.TTP, DVIxxx.TTP, MF.TTP (TOS means,
there are no calls to GEM-VDI/AES) in the background. The sueecial
features of MultiTeX reside in its shell, which allows a comfortable
use of TeX in a multitasking environment like MultiGEM/TOS.

I looked at this software as well, and it looks good. Anyone know where I can get (or a good source to check out) new/used 150Mb QIC tape drives, or other good SCSI tape drives (inexpensive DAT drives maybe)? I need to make better backups, but backing up one 213Mb drive, and two 65's isn't exactly fun (and syquests are a little steep just for doing backups).

HiSoft currently distributes HighSpeed Pascal, an ST Pascal compiler that claims to compile Turbo Pascal source. I haven't seen it (or even seen it reviewed) yet.

Goldleaf Publishing distribute HiSoft's stuff in the US, but since the product is Danish in origin (i.e. not written by HiSoft) Goldleaf may not be the US distributor. Best thing is to give them a call (can anyone in the US supply Goldleaf's address?)

I agree.

>My guess is that the reason the ST hasn't flown (apart from the obvious
>(IBM's clout)) is atari's inactivity. Until the overpriced TT in 91,
>atari used the *same cpu for 6 years* and only doubled the clock on
>some models in 90. Meanwhile ibm/clones changed cpu 2 or 3 times and
>quadrupled the clock (similarly for macs). You can't win a race
>standing still.

From my perspective, the reason the ST hasn't taken off is simply that
Atari didn't produce enough machines to make it worth their while to
market them (at least in North America). Their 68000 machines have more
power than most of the MS-DOS users need anyhow. It's just that no one
knows about the computers, so they can't buy them. And Atari didn't make
enough machines to satisfy all those customers who would want them, so
they didn't market them.

(In reference to the comment I made about the amount of power that
MS-DOS users need, contrary to what the PC rags would like you to believe,
everyone doesn't use a 486/33 with Windows.)

The music still doesn't play during the game.. the programmers did a minimal port to the ST/E & TT.. it makes no use whatsoever of the Microwire DMA sound generator, it's all done in software using the standard ST sound chip!

Even better to program setenv also on a.a I believe. If I recall correctly
environ starts AES directly while setenv just installs itself in the appro
piate vector and waits untill it is called. Both methods work but the latter
is saver and more general.

But what keeps Atari from designing a different case when they release it
(if they ever will). Or for that matter they could change some of the specs
that were announced, they did it before didn't they.

From all the rumours and publications about the Falcon sofar the only
relevant information is that Atari is working on a new cheap computer
based on the 68030 with a multi-tasking capability based on MiNT. It will
probably have better sound and video and they hope to market it within the
next year.

The only thing that suprised me is that they showed a working model on the
Cebit I didn't espected to see such a machine before the Atari Messe in august.

>'PC' or 'IBM'. Kind of a nice touch.

Just to make sure everyone's clear on this, it's not the actual word 'Atari'
or 'IBM' that's in the file. It's a flag that's set. If memory serves, 1
means IBM, 2 is Macintosh, 3 is ST, 4 is UNIX, and on it goes.

DM> "internal turbo" method is so much cheaper overall.

Apparently you don't know HOW the double-clock chips work twice as fast.
Do NOT, in fact, double the clock rate, but instead use HALF clock-cycles
(like the motorola's have all along). A 25/100 chip would not exist,
unless you had two clocks... one for the motherboard at 25, and one
for the CPU at 50/100. It really would not give you much of a speed
advantage to make the CPU run at 4 times the rate of the external RAM.
Unless, of course, Intel comes up with a much less brain-dead memory
accessing method.

I've just been given some STfm software, and I'm having problems getting Ranarama running. I get the title screens OK, but as soon as the game starts, it comes up with 2 bombs.

Is this a TOS incompatability problem? It works OK on a TOS 1.2 machine.

I know that Ranarama is an old program, but I'm wondering if there's a patch around that will get it going.

From: lombardo@odin.unomaha.edu
Message-ID: <lombardo.706727073@odin>
Source record: 221711

Has anyone been sucessfull in getting FZD Term Version 2.12 to print an ascii text file on an epson compatible printer? For some reason, if I try to print a text file using the built in Print Text File on the Disk Commands screen, it doesn't send a LF to the printer, and it prints over and over, and then finally gets a LF, and then prints over itself again!

I have had no problems printing text files from the desktop, or when using UIS III. Why wouldn't FZD Term be able to print on probably the most common type of printer there is?

I hope it is a problem with MY setup, and not FZD Term itself, but please send any suggestions you might have concerning this problem.

Thanks in advance.

5435. Dumping Emacs

Newsgroup: comp.sys.atari.st
Date: 1992-05-24 17:18:28 UTC
From: sundsted@cis.uab.edu
Message-ID: <1992May24.171828.21848@cis.uab.edu>
Source record: 221713

I`m having some trouble dumping Emacs1857. I initially tried it with Mint/Mintshel (after setting the proper env variables) and I ended up with a mangled hard drive. After recovering, I tried it again (this time with no Mint and under Neodesk 3.0 so that I could take advantage of its enviroment setting capabilities). Again I whacked my hard drive. Am I missing something here? The documentation says that I should use Bash (unixmode version I presume)... is this really necessary? In the second instance, I used a unixmode aware version of mv to rename all of the files properly (it created the necessary .dir file)..
I guess I`m wondering if there is a foolproof way of dumping emacs straight from the *.zoo file on a system with Mint/Mintshel. Zoo (aparently being non-unixmode aware) chops of any filenames which are too long.
I would appreciate hearing from successful dumpers. Thank you all in advance.
Todd

Huh, It doesn't matter where the machine came from, it can be
fixed anywhere.
Mine wasn't fixed at the same place I got it from.

>Atari is going to change the distribution of there products to STE's only here,
>and only though Department stores.

That's Ok by me, you can't keep on making old stuff forever, your competetion
will keep going and you'll be left behind.
As for the department stores... maybe that might be good, maybe not.
Hopefully if they do that they'll bulk buy & keep the prices down??

>No one is bringing in software any more here, all dealers that I have talk
>to are going to close or change to the PC, the only dealer here in Wellington
>has had his suplies of machines cut off..

When did this take effect... are you saying that software suppliers are
no longer dealing in Atari stuff. I thought they wanted to sell
the Atari dealership for 1/4 of a million dollars, have they just
given up on it instead?

>Atari clubs here in the North Island are closing at a rapid rate, also Kmart
>has droped the Lynx for the Game Boy, and no support for the Atari machines at
>all...

I don't know what people see in the Game Boy anyway!! It's more
expensive, and has a boreing mono screen.

>Atari also just stated a 13.2 Million loss, so you think that Atari is
>doing good, No Way here at all, go and talk to some of the dealers here
>in the North Island..

That doesn't really matter... we've already got our machines (which are
good), and all the third parties aren't about to close up unless we
stop supporting them. Also there's still loads of GOOD new shareware
software coming out.

>Tell me were did you get your Hard Drive, not here was it..??

Nope, does that matter?? I could have if I wanted to, a shop here can
supply them, but I wanted to do it myself.
In this day and age, buying something from the other side of the world

isn't a hastle at all, and if you really want to, you can have it
the next day. I chose a cheaper way and waited 2 weeks.
With the systems in place (International acceptance of major credit
cards almost anywhere, money orders etc put together with excellent
freight options) there is no NEED for a local supplier, I can simply
ring the USA & place an order on my credit card & specify how
to send it to me. Much easier than going to town here actually when I
think of it that way!!!

Craig.

>of the AUTO folder-- every time I boot off of the hard drive, the AUTO
>folder kicks in and it locks up! In order to access my hard drive
>(which is a 50 meg MicrOtyme ICD special), I have to boot off of the
>hard drive to load up the device drivers; I can't turn the hard drive
>off, boot my computer off of a floppy, and then access the hard drive
>to remove the file out of the auto folder as the Atari doesn't
>recognize the existance of the hard drive as it didn't exist at boot
>time.

I've stuck crashing accessories etc on my HD heaps of times!

What I do is get the computer going with the HD turned OFF.
Insert your HD software into your floppy drive.
Run the HD driver program (if you've got ICD software it's ICDBOOT.PRG)
Turn ON the HD
Click ONCE on the Drive A icon, then select INSTALL DRIVE under OPTIONS
on the menu bar
Click on the drive letter and use the keyboard to change it to C
Click on INSTALL
You will now have a Drive C icon on the desktop
Double click on drive C
Double click on the auto folder
Drag the offending program into the Trash
Reboot your system

This information comes straight off the top of my head and comes with
no warrenty, and batteries are certainly not included :-)

Craig.

I've heard a little about this game recently.

Could someone who has played it post a short review of it or just give
us there thoughts ("liked it" or "sucked donkeys") about it?

Also, in case it's worth it, could someone give an address of a mail
order hous where a copy could be obtained (and how much)?

Thanks to whomever responds.

5444. ANSITERM

Newsgroup: comp.sys.atari.st
Date: 1992-05-25 02:07:28 UTC
From: Mark.Spacek@fquest.FidoNet.Org
Message-ID: <706880563.0@fquest.FidoNet>
Source record: 221848

Somebody expressed an interest a few days ago in ANSITERM, the 16-color ANSI emulator term program. I sent it to atari.archive quite a while back, but the validating of files is going pretty slow there these days. Today, I sent the new v1.0 version that was released on the 18th. I saw someone mention that you can get files from the \atari\new directory if you know the name. So, I thought I would post the names in case anyone is anxious to try them out. ansiterm.lzh is v0.5 of ansiterm. Its the first release I got and is very basic, no dialer, no U/D capability, etc. ansitrm1.lzh is the new v1.0 release I just got. It has a phonebook autodialer, and supports U/D with XYZ201. There is a ramdisk included in the file so that floppy users can load XYZ into it and not have to keep it on floppy. XYZ is not included, but is available elsewhere at atari.archive, you will need it to upload or download witn ANSITERM v1.0... Anyway, it uses low res 320x200 with a 4 pixel mapped character set to get 80 column 16 color ANSI and is a neat little term program. Tim Miller did a good job on the latest version. Oh, one other thing. The older version includes a character set editor not included in the latest release, so you'll have to get it to if you want that. And there is also an ATASCII emulator in the latest archive, if I'm not mistaken. I haven't tried that yet though. Anyway, FYI to anyone interested.. Mark...

5446. Re: SST on STe?

Newsgroup: comp.sys.atari.st
Date: 1992-05-25 03:56:40 UTC
From: dsmall@well.sf.ca.us
Message-ID: <1992May25.035640.5777@well.sf.ca.us>
Source record: 221736
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

The posted question asks if we're going to do an SST for the Mega STE. (There are two radically different flavors of STE!)

While we've found a way, it's up to us to determine if we will sell enough to be worth the VERY expensive R&D. Remember, if we funnel money into this project, there are others that won't get done.

No decision "for sure" yet on Mega STE. Regular STE we have the board layout for done.

5447. Re: SOFTWARE: Virtual Memory for the TT

Newsgroup: comp.sys.atari.st
Date: 1992-05-25 04:06:17 UTC
From: dsmall@well.sf.ca.us
Message-ID: <1992May25.040617.5958@well.sf.ca.us>
Source record: 221735

I suppose this is a little off-topic, but the basenote mentions that copying the TOS ROMS in the TT to TT "Fast" RAM gives 35% improvement. We plyed with this,
had extensive crashes, and Q-ibndex showed us a palty 9% speed increase.

The machine is simply video bound. That's why SST memory is non video, so we don't have to slow to 8 MHz all the time.

There are utilities (I wrote a "romtoram" once), but they tend to destalibze the system. Oh, I did the right things ... set up the MMU table, pointing $E at the ROM image, write protected it, copied at IPL 7 with the usual keyboard kludge that takes ... and it still was not stable. Not recommend.

We found about 20% in real speed, not benchmark speed, in other ways.

Anyway, don't bother putting your ROMS into fastRAM. Reported bugs include repeated crashes and floppy disk formattingh spazz-fits.

-- hope this helps someone, Dave / Gadgets

5448. Re: Spectre and SoftPC

Newsgroup: comp.sys.atari.st
Date: 1992-05-25 04:13:21 UTC
From: dsmall@well.sf.ca.us
Message-ID: <1992May25.041321.6067@well.sf.ca.us>
Source record: 221732

The base thread asks if SoftPC, the IBM emulator, works on the Spectre.

Yes, it does, if you get the "Universal" version or the "Portable" version.
They keep changing names faster than I can keep track of.

I would call them, explain your situation, and ask which one works
today. It DEFINITELY works.

Speed will depend primarily on how much SST RAM I can get involved.
With D-RAM at insanely fast speeds like 40 nsecs (!!!), if I can get the the
fetch/lookup/dispatch/return code loaded into the 68030 cache, it will scream.

5449. Re: Falcon (noch einmal)

Newsgroup: comp.sys.atari.st
Date: 1992-05-25 04:43:35 UTC
From: dsmall@well.sf.ca.us
Message-ID: <1992May25.044335.6404@well.sf.ca.us>
Source record: 221731

The thread discussed the 1040'ish case of the Falcon.

I was in for a rude and sudden shoc at the cost of the mold for the plastic of the Spectre GCR. It is a very simple mold, relatively, yet it cost many thouands of dollars. Atari's earnings statements are not that great right now, and they could really stand not to toss, say, $100,000 into a new mold. (Besides, we might get another wedding cake! :-))

The plastic is cheap ONLY after the mold is done.

I think Atari did right sticking with the 1040 case.

Just my opinion; feel free to disagree.

From: dsmall@well.sf.ca.us
Message-ID: <1992May25.045641.6625@well.sf.ca.us>
Source record: 221734

My apologies on the lack of discussion of the 68030 SST. We ship them out as soon as they get out of testing, and there are discussions of them online, as well as magazine reviews, now showing up.

The Well, the UNIX box I dial into, had a hardware upgrade that fought with the software for some time. Then, just when that is getting fixed and the Well is peeking onto USENET, my son Eric breaks his leg tackling a Camaro (to put a lighter face on it). Week of traction & surgery, so we've not been here to answer phone, FAX, etc.

SST is now past backorders of last July, and orders are accelerating. We do first come first served.

As for this keyboard, I think I'll give up on it! Takes too much editing
to rfix all thegoofs.

-- thanks, Dave / Gadgets /

p.s. NO, Spectre 3.1/3.2/3.x HAS NOT BEEN RELEASED. IT DOES NOT EXIST. It is close, but not there yet. You should see the 50 faxes we get a day ordering it.

>all in advance.
> Todd

I don't really understand this. I have been able to dump without any problems,
even though I dumped from the desktop, due to limited memory, using the environ
program to set variables.

From your descriptions it seems evident that the problems is not in the shell.
You don't describe precisely where in the process the problems arises, but the
are two (actually three) times, where disk-acces is involved. First emacs
starts and loads lisp-files, and then writes an executable image to the disk.
This process is repeated, and then a special program compares the two images
and write the relocatable program to the disk.

This does work in my setup, and I really haven't any clue to how it can fail in
your setup. It could be ressource limitations (memory/diskspace) causing a
fatal error, or perhaps a subtle download-fault has changed some executable in
a fatal but still runnable manner, even though this would be statistically
almost impossible.

Try giving more details about your setup, the dump-process as it appears on
your machine and the nature of the mangled drive.

If you enjoyed Pop I, then you'd enjoy Pop II twice as much, or
maybe more.

But, unfortunately, the Music option is not installed on the
ST version... So, no more music than in Pop I.

5457. Can I use GDOS fonts without GDOS ?

Newsgroup: comp.sys.atari.st
Date: 1992-05-25 09:58:11 UTC
From: cshera@uta.fi
Message-ID: <5820@kielo.uta.fi>
Source record: 221739

Hello,

the subject line says it all.
I've been trying to print text onto screen
with GDOS fonts I ftp'd from atari.archive.

I have tried to do it with A008 (TextBlt line-a
command) and with VDI functions Text (opcode 8)
and Justified graphics text (opcode 11, func. 10).

Language I am using is assembly.
First I've put the address of GDOS font into the
FONTRING[0] line-a variable.

With TextBlt a mark-character (one found in menus,
ascii 7 or 8 in atari system fonts) is printed
on screen.
With Text wanted characters are printed on screen,
but using system font.
With Justified graphics text nothing is printed.

With VDI functions I used a Set text face (opcode 21)
before trying to print anything. Value it returned
(selected font) was correct, so that is ok I suppose.

So what is going wrong or is it just this lack of GDOS ?

My knowledge on the subject is from SALAD and books
published by Abacus (Internals & GEM progs ref.).

Thanks

Heikki Rasimaki

MultiGEM has to adapt itself to each TOS version. If you have an older
version of MultiGEM it won't ever work on TOS 3.06. As far as I know V1.05
works.

>BTW, I have seen the FALCON but signed a nondisclosure agreement. Sorry!

> us there thoughts ("liked it" or "sucked donkeys") about it?

Well, I quite like it. There's 9 missions (I think, perhaps 8) but they are fairly easy. It's certainly not the worst game around, and the introduction/graphics are impressive. Oh, nice sound too.

Adam

5460. Cannot read atari-720KB discette on IBM-AT ?

Newsgroup: comp.sys.atari.st
Date: 1992-05-25 12:44:42 UTC
From: stucki@math.fu-berlin.de
Message-ID: <0TJ39VQ@math.fu-berlin.de>
Source record: 221746
Cross-posted to: comp.sys.atari.st,fido.ger.atari,zer.z-netz.rechner.atari.allgemein

Hi!

This may be a faq, but...

Im a UNIX(!) Sysadmin not ever using Atari and mostly
using an IBM-AT for a Terminal; a few people came this week
trying to read Atari Diskettes on our IBM-ATs.
Mostly it works, BUT...

Some Diskettes are unusable, giving strange results.

Both cases (two Users did ask me personally) were 720KB
Diskettes, formatted on IBM, then written on ATARI,
there readqble, now unreadable on IBM.

Seemingly the boot-sector got lost somehow (copying an
original DOS-Boot-Sector on Sector zero did help).

Is there a typical Szenario which does destroy IBM-Diskettes
on Atari (One user claims 'it did work last week') ?

May it be a Virus on Atari (The IBM'S are checked)
or some unknown TSR, or a misunderstanding between
formats/bios ... or else .... ?

Thanks for MAILING Answers, Yours C.v.Stuckrad

Hey, it's really great to see that *someone* reads the FAQ I put so
much time and effort into!

In article <1992May22.134232.27188@cs.unca.edu> mcmahan@cs.unca.edu (Scott McMahan --
Genesis mailing list owner) writes:
>[...discussion of monochrome viewers deleted...]
>
>: quickgif GIF "slide-show" viewer. Very fast and good results.
>: ATARI-ARCHIVE: graphics/quickgif.lzh.
>
>I think this is for color or something.
>

Indeed it is, and it's the best color GIF viewer I've seen. Someone
else mentioned dmjgif - and that's probably the best GIF->Spectrum
converter available (that I've seen, anyway), but you don't REALLY need
to spend all that time converting just to view, right? Go for QuickGIF...
(BTW, I think you're wasting your time if you don't view GIFs in color!)

>: viewgf Image viewer (many formats, including GIFs) - good.
>: ATARI-ARCHIVE: graphics/viewgf12.lzh.
>
>Great user interface! I wish mgif had it! This thing tries to

5463. MiNT and Megamax Modula-2

Newsgroup: comp.sys.atari.st
Date: 1992-05-25 13:32:30 UTC
From: cb@informatik.uni-kiel.dbp.de
Message-ID: <9338@magnum.informatik.uni-kiel.dbp.de>
Source record: 221749

I have tried to use GEM-programs compiled and linked with the Megamax Modula-2 Compiler under MiNT. I couldn't find a single program, that worked:
- The shell wouldn't start,
- none of the demo programs would start,
- not even the most simple GEM-program would start.

Is ist my fault, MiNTs or is it a megamax bug?

Any help would be appreciated

Christoph

5464. Re: Falcon (noch einmal)

Newsgroup: comp.sys.atari.st
Date: 1992-05-25 13:49:38 UTC
From: aa399@cleveland.Freenet.Edu
Message-ID: <1992May25.134938.1754@usenet.ins.cwru.edu>
Source record: 221750

In a previous article, dsmall@well.sf.ca.us (David Small) says:

Hi Dave, It is great to see you posting on the net. I love your products
and hope to see you produce some great stuff for the new Falcons (that
I'm going to purchase).

>
>The thread discussed the 1040'ish case of the Falcon.
>
> I was in for a rude and sudden shoc at the cost of the mold for the
>plastic of the Spectre GCR. It is a very simple mold, relatively, yet it cost
>many thouands of dollars. Atari's earnings statements are not that great right
>now, and they could really stand not to toss, say, $100,000 into a new mold.
>(Besides, we might get another wedding cake! :-))

> The plastic is cheap ONLY after the mold is done.
>
> I think Atari did right sticking with the 1040 case.

I agree and disagree with you. I agree that the mold costs a lot of
money to make and that the 1040 style case isn't that bad but
I believe they should alter the case in some ways.

For one thing, Atari puts those darn joystick controllers underneath
the keyboard. How many people have complained about where those are
located and they continued to put them there on the STe (except for
the analog ports). Another thing is the height of they keyboard.
As I write this, my fingers are getting REALLY tired. It would be awfully
nice if they could put the keyboard a little lower.

How about the "mushy" feel of the keyboard. This is no doubt one reason
the STs are selling so cheap though I would love to see a little better
feel to the keyboard.

The grey color of the STs was a good choice. I have no complaint
about that. It hides dirt GREAT. I work at the computer center at
school and when those PS/2s get dirty, you know it!

I wouldn't mind the computer extended a couple inches in the back
to fit everything that needs to be put in it. And room for developers
to do their thing.

I believe that if Atari is going to attempt to market new computers
that will be their salvation, they should do it right.

I don't know how they cannot change the mold of the new computers
with all those extra ports being placed on it.

I also better not see another "wedding cake" design. The design was
pretty bad.

The power and reset buttons should have been located in the front
of the machine. I can't imagine why they would put the power switch
all the way in the back!

The top of computer was so small that it couldn't even fit the monitor
completely on it.

The keyboard cable connected was connected on one side of the keyboard
to the opposite side of the computer.

But all in all, the 1040 style case is a heck of a lot better than the
Amiga 500. I've used both and there is no comparison, the 1040 is better.

It is true, Atari did lose a lot of money last year but they are still
in good shape. I think they can afford to make a couple new molds.
In fact, if ATARI wants me to be there when they are designing it, I'm
on my way. I know what I like.

I was under the impression that the Falcon case is one piece, but that it's a new design, different from the 1040. Is it true that the case shown at the shows is really a 1040 case just painted dark gray? AAK!

5469. Re: What is the best GIF viewer?

Newsgroup: comp.sys.atari.st
Date: 1992-05-25 16:15:46 UTC
From: mcmahan@cs.unca.edu
Message-ID: <1992May25.161546.25977@cs.unca.edu>
Source record: 221803

One more I just downloaded: gemview. Hated it! :)

It didn't do a good job on gifs, not better than the ones I've already had, and is primarily a desk accessory, something those of us with 1 meg *don't* need. Re-naming it to a .prg (the docs are in German, so I guessed) yielded a menu bar, but nothing great.

Scott

5470. Looking for Mr Steffens

Newsgroup: comp.sys.atari.st

5471. Mint 0.94B (System Functions - Which are faster?) AND (Memory Mngmt.

Newsgroup: comp.sys.atari.st
Date: 1992-05-25 17:13:41 UTC
From: mforget@ersys.edmonton.ab.ca
Message-ID: <i2acLB1w164w@ersys.edmonton.ab.ca>
Source record: 221808
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hello.

At last, I have managed to aquire MiNT 0.94, and now that I have it running, I have two questions. One relates to programming, which is why this message also appears in comp.sys.atari.st.tech, and the other relates to how BGACC works.

1. I have a terminal program that I have just about finished the second version of, but after installing MiNT I've noticed that the terminal mode is MUCH slower than before. I currently use Crawio() to put text on the screen and Bconin() to get text data from the modem. Does the ST have a faster output routine than Crawio()? If I would like to continue using my own program, I'd better make it faster. Up until now, it has handles V.42bis compression with an actual connection rate of 2400 baud.

2. Is there a way to prevent programs that BGACC.ACC starts from taking up all the memory the system has left? Also, is there a way to pass a command line to programs started in the same manner? I've noticed that BGACC.ACC doesn't wait for command lines at all. I like the windowing that it does, though.

I should mention that I uncommented the line "HARDSCROLL=25" in the MINT.CNF file so that hardware scrolling would be active. The desktop I am using is Gemini 1.21 for the moment, and my system has two megabytes of RAM. After everything is up and running I have 940K free. BIOS buffering is also set to ON.

I hope someone can help me out with either of these questions.

Source record: 221807

Hi,

since my TT 030-08 sometimes runs out of memory :-(running large jobs
on it (like recompiling g++-lib with -O or so) I plan to use (i.e. buy)
a V-RAM program for it. As far as I know, there are OUTSIDE TT (Maxon) and
VRAM 2.0 available.

(1) Does anybody have *real* experiance with this programs or did anybody
try to use them in connection with MiNT or/and the atari-ported gnu
software suite ? Any caveates discovered ?

(2) Did anybody have ported EMACS so, that it uses MiNT multitasking
abilities ("M-x compile" should work, the info reader should work
and so on ..)

Thanks in advance for any useful hint,
Stefan

5474. Burned by a Usenet user...

Newsgroup: comp.sys.atari.st
Date: 1992-05-25 19:08:01 UTC
From: yellowbd@eskimo.celestial.com
Message-ID: <1992May25.190801.19686@eskimo.celestial.com>
Source record: 221836

I am posting this here to let the other netters know what can happen to them... I will present my case here and let you decide if my feelings are justified...

What happened:

Some months back there was a posting to comp.sys.atari.st offering a copy of the Abacus book "Atari ST Internals" for sale. Responding via email I began corresponding with Kosmatos Odisseias (sp?) who informed me that he had already agreed to sell his copy of the book to another person... But he had a friend who also had a copy he was interested in selling. Kosmatos gave me the email address of his friend, one Bruno Schmidt, to see if we could reach an agreement on the sale of this book. I made contact with Mr. Schmidt and an agreement was reached. He sent me his postal address for me to send the money and I responded with my address for him to send the book... The money was sent out in late March, and I have yet to see my copy of the book... Over the intervening weeks, I have attempted to contact Mr. Schmidt at his email address with no success... My mail has not been bouncing back to me, so I can only assume that he has either lost his access to the net, or is intentionally ignoring me... I feel that over two months is a tiny bit excessive in waiting for him to send my book. I would feel better if he had responded to my attempts at contacting him. By his silence, I can only assume that he has no intentions of sending me the book he 'sold' me nor returning the money I sent him in good faith...

It is sad to see this kind of behavior among the members of the Usenet community and I just wanted to let other users know that this was happening... It is especially sad to see this kind of behavior among the atari community since we all need each other's support as that is probably the only _real_ support we can expect for us and our computers...

If anyone else is outraged by this kind of behavior and would like to let Mr. Schmidt know what they think, I am going to include his email address in this post... Please feel free to send him a quick note to let him know your feelings on this subject!

email: brunos@mafalda.math.mcgill.ca

I appologize to Mr. Odissieas in the likely event that I have misspelled his name...

Also, if anyone else reading this has a copy of the "Atari ST Internals" book they are interested in selling me please feel free to email me at: yellowbd@eskimo.celestial.com

> faster output routine than Crawio()?

Fwrite() is enormously faster than Crawio, at least under MiNT (probably not under TOS; and TOS also doesn't provide any way to make Fwrite do raw output :-( ). The reason is simple -- you can transfer a whole lot more bytes per system call, and system calls are expensive.

> 2. Is there a way to prevent programs that BGACC.ACC starts from taking

> command line to programs started in the same manner?

The answer to both questions is the same: run a CLI in BGACC windows. Then you can launch programs with the "limit" command (see the MiNT utility package) and/or use whatever builtin features the CLI has to limit program sizes.

5479. help with flakey OPUS!!! Please?

Newsgroup: comp.sys.atari.st
Date: 1992-05-25 20:48:19 UTC
From: dinsmm@marcus.its.rpi.edu
Message-ID: <zt#w0!+@rpi.edu>
Source record: 221809

Hi.

I have been using OPUS on my 104 STf with the one meg and color
monitor. I got the program from atari.archive.umich.edu.

I have no problems loading it and running it. I can make a
spreadsheet easily (although I don't have any medium rez gdos fonts
to use so I can't even use the chart thing) and have no problems
with the use of it. However, when I am done, I save it and that saved
file always causes the program to crash (two bombs whatever that means)
when I try to load it later. I have tried saving it as a worksheet,
and saving it as a saved block. I've tried both ways when loading it also.
What does the two bombs mean? I've tried reloading with and without
gdos and no accesories to save memory, if that was the problem.

Anyone have any clue? Anyone use OPUS with medium rez and with gdos
fonts? Could you help me out with what you have for the gdos setup?
Any help would be greatly appreciated. You might want to reply to me
if nobody else cares about this or never had this problems before.
Thank you.

Message-ID: <1992May25.233819.4797@kosmos.wcc.govt.nz>
Source record: 221813

Well I have just uploaded Rufus Version 1.1 to Atari Archive,

its in the atari/new directory as rufus110.lzh ..

This is the same version that was posted to GEnie some days ago..

This is a English conversion from the looks of it, but it lacks any Doc files..

It does not work as a ACC for me, also no support for the ST/E's medium
resolution (mono only) and it looks like no more background tranfers ..

But Please correct me if I am wrong, so far I have only had
a quick play with it..

But the whole thing looks cleaner and much faster, has built in Zmodem
and a very nice dialer, (called select for some reason) with many options,
also text can now be marked..

If any one knows any more about this program please let me/us know...

Thanks..

Roger..... sheppard_r@kosmos.wcc.govt.nz

5484. Using a composite monitor

Newsgroup: comp.sys.atari.st

From: azog@thoth.rent.com
Message-ID: <1992May26.001015.8149@thoth.rent.com>
Source record: 221822

I am wondering if there is any way I can use a composite monitor
out of the RF jack on the back of my STe? Just for yuks, I tried
it out, but no video was displayed on the monitor. Also, in the Onwers
Manua, appendix B Glossary, under the entry Color Palette it says
that I must use an SC1224 (this was before the new SC1434) a composite
monitor, or television... ?

thanx

5485. Indy Jones and the Last Crusade failure -- again

Newsgroup: comp.sys.atari.st
Date: 1992-05-26 01:18:04 UTC
From: gerardo@uapnx1.dgsca.unam.mx
Message-ID: <1992May26.011804.11868@talon.ucs.orst.edu>
Source record: 221814

In article <1992May19.225942.23324@talon.ucs.orst.edu> I described my setup and some trouble my son's been having with "Indy Jones and the Last Crusade -- the Action game". Bob Malay wrote me privately, suggesting I use 50hz.prg from the umich archives, and Roger Sheppard responded to the net with an implicitly similar suggestion. I take this opportunity to thank them.

I downloaded 50hzboot.prg and swaphz.arc (which turned out to contain "50.prg")

50hzboot.prg ran, changed the frequency setup and asked for a bootable disk. Inserting Disk 1 of Indy resulted in getting back to the Desktop with an empty window open on disk A:\. 50.prg allowed the program to start from the prg file in the AUTO folder of Disk 1, and although the opening screen (which comes up after inserting Disk 2 and pressing "fire") looked better (no odd stripes), it still bombed (three bombs this time, instead of eleven). I would appreciate it if any readers in the UK could get me the address of Lucasfilm Games/U.S. Gold, which, as I pointed out before, is nowhere to be found on the disks or the box.

This would be fine, except for one point of confusion on my part. Serial data (on output) must be one character at a time in most cases. For regular terminal mode, where the user types as I am typing now, each character is sent to the modem as it is typed, since the program would not be behaving correctly if it waited for an end of line. On serial data input, the problem is a little different. A routine could be used to do the following:

/* This is just a explanation, rather than a code fragment. */

Check to see if the serial port is waiting to give data to the computer.
If it is, add the data to the string about to be sent.
If it is backspace or delete, adjust the string accordingly.
If it is a CR/LF, send the string using Fwrite().

Check to see if the modem has more data to give to the computer.
If so, go back to the first (indented) step.
If not, send the string and start all over.

/* End of possibly incorrect explanation. */

The only real problem is determing what the end of the string is, since prompts from BBS systems and line number in their editors are not followed a a CR/LF. So, I guess a string could either be considered terminated when there is a break in the data from the serial port or a

CR/LF is received.

Does this seem right to anyone except me? :) Output while typing would still be one character at a time, but things like ASCII uploads and sending function key macros or the date or the time would be faster than it is now, I think.

If I have made some horrible, evil, insidious mistake in my reasoning, don't hesitate to tell me...:)

Ummm.. Dave... you're not saying you think Atari is going to use EXACTLY the same case as the 1040, are you..?

Are all those new whiz-bang ports and connections going to line up exactly where the old 1040 stuff came out of the case..?

If not, and they have to tool up for different ports, then why not just go for a completely new case..? Or is it easy to change an existing mold for different holes in the case..?

It seems that every ST model that's come out has had a slightly different case anyway... why not make a totally new machine look totally different..?

As someone who rarely sees the desktop on his ST (I either boot to tcsh if I'm running MiNT, or the Craft shell if not), I too feel that a shell is far superior to the desktop. OTOH though, 90% of my time on the ST is spent programming. For a user I'd guess that a decent desktop would be more suitable (in most cases, anyway). Having said that, I'd sooner use Gem than Dos, and I'd guess that the people you mentioned above would feel the same way. Even improvements like 4dos don't help that much.

I don't think this is very helpful. If the original poster doesn't already know, the battery life on a stacy is so short that a stacy is no real use unless you are sitting next to a main socket. However, it is portable in the sense that it can be moved from place to place without hassle and as such is probably worth slightly more than a 2nd hand STFM with the same memory, mono monitor and hard disk size (Which depends which country you are in - about $2 in America :-))

>>gday,
>> after reading all the rumours about the Falcon, has anybody
>> heard about the Sparrow ?
>>
>Perhaps it was eaten by the Falcon :-)

The first time I heard about the Sparrow was that it was a cheaper version of the Falcon that was originally going to be shown at a show in Germany earlier this year. The magazine I read about it in didn't seem sure whether Sparrow was the correct translation from German.
However, with most speculation now pointing to a 16 MHz Falcon, I can't see any room for a cheaper machine.
Here is a summary of rumours I have heard about new Atari machines:

Late summer last year New Computer Express (RIP) had an interview with Sam Tramel (however you spell it). He said that over the next year Atari were going to release 5 new machines - 2 portables (The Book and Pad), 1 console (Jaguar?), a home computer (Falcon?) and a CD-ROM add on.
The Book is now available and seems quite good. However it is considerably overpriced and I can't see anybody buying it other than musicians.
The Pad/Stylus/Dodo was permanently shelved a few months back.
The Jaguar was the replacement for the Panther (which was shelved because Atari didn't think it was powerful enough). Sam claimed that this was a 64-bit machine (although it is thought to be Falcon compatable using a 68030 and NeXT DSP) and that it would cost less than $400 (Read: 399 pounds sterling). I haven't heard anything about the machine for ages.
The Falcon wasn't actually named by Sam, but I assume that's what he was talking about. He gave the impression it would be based around a 32MHz 68030.
The CD-ROM has now disappeared again.

Early this year there were rumours in Germany of a "cheap" version of the TT, running at 16MHz. These were followed by stories in the main UK magazines of a new computer to be released the next month in Germany which would cost "under 600 pounds" or "less than 400 pounds" depending which magazine you read. The following month there were lots of excuses about why they got it wrong and that the new machine had been delayed until later in the year. This is when they reported on the codename "Sparrow" for the new machine.
Since then the Sparrow hasn't been mentioned, only some specs which all include a 68030 @ 16MHz and a Digital Signal Processor which must be good because it's name is lots of digits long (and is in the NeXT machines apparently).

Anybody heard an other rumours? And anybody know what exactly this NeXT DSP can do?

It's a Megamax bug.

I wrote to Thomas Tempelmann some weeks ago, because I had a problem
with the editor. He said he'd no time for the *editor*. This gives me some
hope for the future.

Gerd

P.S. We solved the editor problem.

Floppyshop in the UK claims to have a program to allow you to load Spectrum programs from tape (including instructions for a cable that connects through the printer port). Its on the same disc as the emulator. I haven't actually seen the program, but there was an article a few years back in ST Update which gave the cable details and a program to load in pictures from the Spectrum (quite who would want to, though, is anyone's guess.)

I have the same problem with megamax modula, version 1.1; its caused by
the storage module, because it tries to step into the gemdos to get some
pointers from the memory management (the developper of that module said so),
and it will terminate, if it fails; so there is our problem, because MiNT
uses a very different management.
I dont know of any working solution for this, but maybe there is someone
on the net who does.

5508. .FMT files required for 1 Meg/Floppy TeX set-up

Newsgroup: comp.sys.atari.st
Date: 1992-05-26 13:52:39 UTC
From: dh108@cs.city.ac.uk
Message-ID: <1992May26.135239.29687@city.cs>
Source record: 221842

For anyone who was following my (fairly) recent posting on
how to set up LaTeX on a 1 Meg ST without a hard drive,
I have uploaded the two .fmt files, plain.fmt and latex.fmt
to the atari archive. They can be found in the directory
tex/cs-tex-4.0 in the file:

-rw-r--r-- 1 atari ftp 255694 May 22 15:05 2formats.lzh

This was produced using 'lzh201d' found elsewhere on the archive.

>>> Seems strange... why were you dealing through OZ in the first place??
>>
>>One these machines came from OZZ, like a lot of Dick Smith suff does..

>
> Huh, It doesn't matter where the machine came from, it can be
> fixed anywhere.
> Mine wasn't fixed at the same place I got it from.

> Craig.

Craig I don't think you understand trade laws here, these machines are New
under warranty, so they must go back to the warranty holder,
that is Dick Smiths, not Software Supplies or any one else.

Disk Smiths did not have any working machines at all, one friend here, changed
his machine 5 times and still had a bad one, also Disk Smiths had no
hard drives to test them with, so I offered to fix them for some chaps here
after getting the new DMA chips from Atari OZZ..

There are no longer any Atari dealers in the lower North Island, thats how bad
it is..

Roger.... sheppard_r@kosmos.wcc.govt.nz

Yup, SpiritWare Bible concordance is SHAREWARE and is excellent.
An old version with the Authorised Version of the bible is available
from all good PD places (e.g. on-line from lancs.pdsoft).

For around 30 dollars they will send you version 3 with the NIV bible.

I have a couple of games that I would like to play, but they dont seem
to like my tos. Is there any way to get them to work? I have a
1040STe with tos 2.06. Tha games I am having problems with are:

The Curse Of Ra
F16 Combat Pilot

Any clues? Do these programs require tos 1.0 or some such?

John

P.S. does anybody have a list of games that wont work on a 2.06 tos machine.

5515. More problems with Emacs

Newsgroup: comp.sys.atari.st
Date: 1992-05-26 15:44:15 UTC
From: sundsted@cis.uab.edu
Message-ID: <1992May26.154415.8950@cis.uab.edu>
Source record: 221849

After another round of fighting I am still having problems getting gnuemacs up and running. But first, let me thank everyone who helped me with the first round of problems (they are all solved)...
I can succesfully start up emacs, however whenever I try to access a file (either writing or reading ^X^F or ^X^S or ^X^W) the program dies and I get a message of the following type:

```
pid 9 (emacs) :BUS ERROR: UserPC=0 (basepage=65c2c)
BUS ERROR
```

and emacs dies. I _can_ M-x various lisp files such as hanoi, and they work fine. This only happens when I want to load up or save a file. I have increased the dubugging level of MiNT in order to see what was happening, but nothing was output before the program crashed. Everything else (I think) works. This is causing me a great deal of anguish as I use gnuemacs exclusively at work and would love to have a working version at home too!
Here is the relavant information...
Atari 1040ST, tos 1.4, 4 meg memory, connor 100M hard drive, ICD formatted/boot version 4 something. The only programs I have running are MiNT (version 0.94), mintshel, various unixmode file tools (ls,mv,cp...) from atari.archive, and emacs.
On another interesting note, when I have the debugging mode on and run ls I get this:

```
pid 5 (ls): Fseek: bad handle: 4
" 4
" 4
" 5
" 5
" 5
```

and finally the directory listing. Could it be that MiNT 0.94 doesn`t like unixmode things, or they don`t like MiNT?

Thanks in advance for the help.
Todd

My father has been using Atari 8-bit computers for year. He uses LJK Letter Perfect for his word processing needs. Recently he bought a 486 with Word Perfect on it. He has a ton of documents remaining in the Letter Perfect format that he would like to convert to Word Perfect format. We are pretty sure that we can get the files onto an ibm computer. However, we don't know how to convert the files. Is there a utility somewhere in some archive that can help us out? Please send answers to the E-mail address below. Thanks for your help.

5523. Help with Antic/modems desired.

Newsgroup: comp.sys.atari.st
Date: 1992-05-26 19:05:06 UTC
From: grs00196@stat.appstate.edu
Message-ID: <1992May26.150507.2299@stat.appstate.edu>
Source record: 221760

I have a modem problem and I would like some advice and help from modem users. What I need is some advice on a good modem software program to update or replace by Antic FLASH program. Or, if you have experience with Antic I would like to know tips on adjusting it so that it can send information to another board, files that have been imported into the program from a word pricessor as an ascii text. Getting an Antic manual would be helpful. Is Antic in the Bay area? What is the deal with setting up modems, anyway? That's probably my ultimate concern. IF I understood more about them - say as I do with word processing systems since I use them quite a bit - then most of this would not even be happening. That's why the interest in a simple, but user-friendly, campatible software package.

5524. Want to connect IBM KEYBOARD to ST!

Newsgroup: comp.sys.atari.st
Date: 1992-05-26 19:09:15 UTC
From: grs00196@stat.appstate.edu
Message-ID: <1992May26.150915.2300@stat.appstate.edu>
Source record: 221761

User wants to use an IBM-style extended keyboard on Atari 1040st. I have heard of products on the market, but who has used them, what are they, where can these products be obtained, and how good are they. If you have modified your keyboard, know someone who has, or have information on swapping keyboards I'd live to hear from you.

5525. HELP wanted/ALTERNATIVE MONITOR ON ST!

Newsgroup: comp.sys.atari.st
Date: 1992-05-26 19:14:06 UTC
From: grs00196@stat.appstate.edu
Message-ID: <1992May26.151407.2301@stat.appstate.edu>
Source record: 221762

User wants to connect other types of monitors to the ST. I need help from those who have done it and from others who know what type of monitor would best serve this purpose, how much it would cost, things like that. I have read that the NEC Multi-Sync monitor is cited often in the Atari literature as the a type which is used by Atari users. Can others be used; whether others can or not aside though, how exactly does this work. It would seem like some type of device would interface betwen the ST and the monitor's different electrical connections.

> I an looking for an nroff formatter

I just aquired source code for a cool system called CAWF that formats
man pages and nroff documents in general, and includes user-customizable
device drivers so you can support any type of printer or screen output.
I'm in the process of porting it now, and should have ST (TOS) executables
and source code ready to distribute before too long. The source is really
pretty clean and portable; you should be able to recompile it under MiNT,
Minix, or any other ST environment pretty easily.

Source record: 221766

I'd like your opinions, please, on PC-DITTO and PC-DITTO II.

I've got PC-DITTO (the software version) and have been, on the whole, unsuccessful with it. Is PC-DITTO II (the hardware version) any better, or should I junk the ST and buy an IBM? (Say it ain't so...)

I don't necessarily want to run graphics-heavy arcade games with it, but would like to run, say, a CIVILIZATION or a B-17 (both MicroProse games and both--they just informed me today--games which will NOT be ported to the ST).

Thanks awfully.

Gary Anderson

From: azog@thoth.rent.com
Message-ID: <1992May26.212634.14991@thoth.rent.com>
Source record: 221773

I recently downloaded a database program called FastBase, and I like it alot, but cant find out any copyright dates on it, to see if the author is still supporting it. The author is Andrew Brown, and located in England, and the credits state to send 20# to him for the full-blown version. I would like to get it, but for the above questions. And also, will a bank in England cash a check drawn on USA accounts? (never dealt outside of USA like this)

Thanx

I have just recently gotten my hands on a brand new US Robotics Courier 9600 v.32 modem. I hooked it up to the ST, and loaded up FZD Term to try it out! So far, I have only gotten 2400 baud to work properly.

In the FZD Term docs, it says that you need a modem that can set Carrier Detect properly. Does the Courier do that?

It also says you need a Serial RTS/CTS Patch if using a high-speed modem and a version of TOS not supporting RTS/CTS flow control. I have TOS version 1.0 (I know, it's old!)

Can the ST even support 9600 baud?

Please send a reply via email if you have any information I could use!

Bingo. With the existence of the 8/16MHz MegaSTe, there doesn't seem to be any
room in Atari's lineup for another machine between it and the 16MHz 68030 Falcon.
Look for a high-end (higher-end?) 68040 based unit to follow the Falcon, IMHO.
Not to worry though folks, the "little" Falcon will seem _plenty_ high-end to
those of us who are accustomed to ST graphics/sound/etc specs. ;-)

> After using the latter, I've had trouble reading/updating such disks
> under gulam on my Atari. When I switched back to mtools the problems
> have disappeared.

OH NO ! On my machines it is quite the opposite way !!
All the time when i wanted to read a 3.5'-floppy written with mtool-utillities
on a SPARC2 on my ATARI at home, i got corrupted files in such ways that
the first block is ok and then there is a large line with spaces (or
unreadable chars) and then the first block follows again (!!) and that
is repeated several times. And it has really no effect in which way I have
formatted the disk before (formatted on a DOS-PC or on the SPARC2 with
"fdformat -ld" or others) i used several methods, which were posted here,

BUT then, when I used the tip with mounting the floppy on /pcfs under UNIX
(fdformat -ld; mount -t pcfs /dev/fd0c /pcfs) an copying the files under
UNIX, I finaly got the right: the files could truely be read.

I don't know what's the matter was; the only I can say,
after a long time with many attempts , now I have that what I wanted:
files from Sun copied to 3.5'-floppy, which can be read on my (*) ATARI.

(*) I have ATARI 1040ST/FM, 1 MB, TOS 1.2 (from 1987, yeah an old one!)

5536. ANSITERM

Newsgroup: comp.sys.atari.st
Date: 1992-05-26 22:28:55 UTC
From: Mark.Spacek@fquest.FidoNet.Org
Message-ID: <706962221.1@fquest.FidoNet>
Source record: 221800

Just to clear up my earlier post about ANSITERM. I see that since I posted it, someone else sent ANSITERM up also. The file he sent is twsansi1.lzh, the file I sent up ansitrm1.lzh. They are basically the same thing. ansitrm1.lzh contains twsansi1.lzh and ramldlr.lzh both. I mistakenly said in my earlier post that ramldlr was a ramdisk. Its not, I see after looking at it. It a program to automatically load files into a ramdisk. It runs from the auto folder and works with ramdisk programs that run from the auto folder also, I presume. I imagine such ramdisk programs are available at atari.archive, although I wouldn't know the names or locations off hand. The reason I included it was that the author mentioned it when he announced the release of the term program. He said it was useful for floppy users who didn't want to have to keep a floppy with XYZ 2.01 on it in their drive all the time. Loading it into a ramdisk makes it fast and easy. So, anyway, I got it also and included it in the archive. I have friends who don't have hard drives and assume there are many others out there who might want that program. And it was
really small anyway. Thats all.. Mark......

Get real, Atari will discontinue the Mega STe by the end of the year.

It will look like nothing compared to the Falcon 030.

Look for a faster Falcon 030 maybe at 33 MHz and a Falcon 040 at 40 MHz.

You won't get any thing out of the RF port except a Radio frequency TV
signal - that's why it's called an RF port! *8-}

Seriously though, there is a composite video and audio signal available
from the 13 pin monitor socket - go and buy a plug!

The pins to use are : Video - pin 2
Audio - pin 1

All this is detailed in the back of your Atari manual - Appendix B

It works - I've tried it.

5541. MIST Atari Fest IV

Newsgroup: comp.sys.atari.st
Date: 1992-05-27 01:48:36 UTC
From: Dan.Ward@f370.n231.z1.royaljok.fidonet.org
Message-ID: <707013078.F00001@royaljok.fidonet.org>
Source record: 221608

MIST Atari Fest IV
Saturday, July 25, 1992
10:00am to 5:00pm
Castleway Conference Center
6385 Castleplace Drive
Indianapolis, Indiana

The deadline for reserving space at MIST Atari Fest IV is rapidly approaching. Vendors and user groups have until June 1, 1992 to reserve a booth.

So far the following vendors and user groups have committed to attending MIST Atari Fest IV.

Brasoft
D.A. Brumleve
Electronic Spinster Graphics
Missionware Software
Cin'tari
LCACE

We have had considerable interest from many different vendors, but the overwhelming majority of these have not mailed in their registration form and fee!

If you are planning on attending MIST Atari Fest IV but have not returned your registration and fees, please leave a message to Dan Ward, Chairman of MIST Atari Fest IV, on GEnie (D.WARD10) or leave a message on his machine at 317-254-0031. MIST needs a firm idea as to the number of vendors who will be participating at this years show.

There is a strong possibility that MIST Atari Fest IV will be canceled if no more vendors agree to attend. The groups will be voting on this issue at our next meeting, scheduled for June 1, 1992. So please contact Dan before the evening of June 1.

Your support and interest made last year's show a huge success. We hope that support will continue and make MIST Atari Fest IV an even bigger sucess.

Dan Ward - Chairman of MIST Atari Fest IV
President of Atari ST Computers In Indianapolis

It's fairly compatible with Turbo 5.0, as far as it goes, with a few serious omissions, and some rather annoying bugs. But I've been using 1.1 for a while... the current version (1.5) may be much improved. I won't know until I eventually receive my update from England.

> Goldleaf Publishing distribute HiSoft's stuff in the US, but since the
> product is Danish in origin (i.e. not written by HiSoft) Goldleaf may not be
> the US distributor. Best thing is to give them a call (can anyone in the US
> supply Goldleaf's address?)

Not any more. Goldlead no longer handles the HiSoft line, claiming that sales were too low in the U.S. to justify it. I believe that Pacific Software Supply is still handling imports, and I've seen HighSpeed Pascal for sale from Micro-Depot (I believe) in ads in Current Notes, etc.

Even though the product *is* Danish in origin, HiSoft seems to do a pretty good job of supporting it. If you have access to GEnie, you can frequently get your questions answered there by Dave Nutkins or Alex Kiernan in the Atari Roundtable.

I thought I was the only one still programming in Pascal. ;-)

I have also had problems with FZD printing. In fact, I'm looking at a
page with complete garbage all over it right now. I printed this from
the text editor. I also seem to have trouble using Xmodem (1K) transfers.
I get a message that says "four bombs - don't you hate that?" then several
more fatal-error messages before I get dumped into the desktop. What's
up? I have Turbo installed. Could that be it? I used to have Quick ST
installed but that didn't work with this program at all.

Sorry, I tried to get this through to you personally, but the mail
bounced back. This may be due to a new mail system at my site. So here
it is in public.

The rest of you may hit the DELETE key now...

>Yup, SpiritWare Bible concordance is SHAREWARE and is excellent.
>An old version with the Authorised Version of the bible is available
>from all good PD places (e.g. on-line from lancs.pdsoft).

Please remember that I'm in Germany. I doubt that 'good' PD places
here would have it. My ftp-access to outside Germany is highly restricted.
So could you please give me a snail mail address? - Thanks.

>> If possible, please contact me privately since I'm no regular reader of
>> this newsgroup.
>Sorry, Wolfgang, but if you can't even read the net for replies to
>your own posting....

I didn't say I can't. But it saves me a lot of time since comp.sys.atari
isn't the only newsgroup I posted this request to. Btw: some people have
responded already who don't find this practice so strange after all...

Hope to read from you soon.

Usually most modems do ... look at the documentation of the modem, to
set the carrier detect.

> It also says you need a Serial RTS/CTS Patch if using a high-speed
> modem and a version of TOS not supporting RTS/CTS flow control. I have
> TOS version 1.0 (I know, it's old!)

Best...get RUFUS Version 1.11 - there is also the patch for the RTS/CTS
flow control. Rufus is shareware and _now_ a pretty good program.
You can get it at 129.69.1.12 (Stuttgart) or somewhere else. With TOS 1
you need this patch really, especially if you work with a high speed
modem.

>
> Can the ST even support 9600 baud?

Yes...it does it very good. I do not know if you need more patches, if
you use the "beta-TOS" 1.0 ... :)

Usually 9.600 Baud is no problem. I really advice you to get RUFUS, I
think, that the new version 1.11 really works good.

Hi
==

Hi encountered a Problem with bgacc.acc
When running top or ps from a shell (or direkt) running inside a
bgacc window I get a busseror and the bgacc seems to HANG in that window

Is this already a known bug ?

PS: It also would be nice to use a commandline for programs put into
a window.

Gruss
Wolfgang

Seriously - if you are going to America it would be a good idea to smuggle some computer goods back - prices are half there for some things. I don't know whether you get the ads from Americans selling their STs, but I just saw one for a Mega 4 ST for $175. In England it would fetch about 300 pounds - more than three times as much. And a Mega ST is well worth buying since you can fit an SST.

I strongly disagree. Copying the TT's Rom into Fast Ram does not lead to a
destabilized system. I always work on the TT with a Rom copy in Ram and
never had any problems with it. There can only be crashes when other
programs try to use the pmmu. If this is not the case (or these programs
adapt to this situation) there is no danger of a system crash.

Well, the mystery of the HSC archive is solved. Turns out that you need more than the 732K free memory I had in order to install it properly. After rebooting without Gemini and cache90 and the other things I like to use (leaving me with 890K free), everything installed fine. Just goes to show you, the packing technique used in the distribution archive is NOT VERY ROBUST.

Maybe in the next revision, a note in the installation document about this memory problem (or a better packaging scheme) would help? Still, a very nice setup for compiling C programs (it even works with my homemade GEM compiler shell!).

Thanks for all the help in solving this little difficulty!

I did try this, but found that MAKE.TTP did not seem to inherit the
environment variables that had been set up using Ian Lepore's GEMENV. I
didn't play with it too much before giving up.

I'm trying to remember something I read here a while ago, about a
program stealing a vector from somewhere so it could get in after AES is
up but before the desktop. Perhaps it was MiNT? I sort of inferred from
that that the desktop was just an internal program run after AES is setup.

5558. g++ test 'tstring.cc' fails on input. Any hints?

Newsgroup: comp.sys.atari.st
Date: 1992-05-27 14:15:13 UTC
From: haegar@uni-paderborn.de
Message-ID: <1992May27.141513.21956@uni-paderborn.de>
Source record: 221796

The subject says it. I have installed the gnu c++ compiler
and successfully manged to compile all the tests in gplibt02.zoo.
All run successfull and gave the expected output, with the exception
of tstring.cc. It runs fine until it trys to read a string from
cin. I got a buserror there.

Has anyone run this test successfull? Or is this behavior normal?

My setup is:
Atari ST with 3 MB (compiling without optimisation is possible)
TOS 1.04, UNIXMODE = /.,drcLA
gcc, gcc-cpp, gcc-cc1 and gcc-cc1p are patchlevel 2 compiled with
our local cgcc.
l++.olb is patchlevel 7.
gnu.olb is " 79.

Greetings
Thorsten

5559. Re: PC DITTO.....?

Newsgroup: comp.sys.atari.st
Date: 1992-05-27 14:21:42 UTC
From: hutch@bellman.lanl.gov
Message-ID: <1992May27.142142.28948@newshost.lanl.gov>
Source record: 221795

In article 16248@unlinfo.unl.edu, ganderso@unlinfo.unl.edu (gary anderson) writes:
>I'd like your opinions, please, on PC-DITTO and PC-DITTO II.
>
>I've got PC-DITTO (the software version) and have been, on the whole,
>unsuccessful with it. Is PC-DITTO II (the hardware version) any
>better, or should I junk the ST and buy an IBM? (Say it ain't so...)

Gary, PC DITTO was a neat hack and the first of its genre to be successful. Trouble was (as you well know) it ran too slowly to be of any real use.

PC DITTO II (the hardware version) _should_ have done very well. Unfortunately, the good folks at Avant Garde ran into all sorts of production and legal problems and had to close their doors so the product is no longer supported. Quite a few folks had problems installing it and getting it to work, although mine worked flawlessly. Even if you could find one, I couldn't recommend it now.

There are a couple of other options today, however. ICD makes two PC emulators, the PC-SPEED and the AT-SPEED (roughly US$200 and $400 retail, respectively). These are hardware/software emulators and from all reports, do a fairly good job.

There was another very popular unit from the UK by the name of "Turbocharger" (is that right? Can't remember for sure) a couple of years ago which was an external standalone unit that sold well even at a somewhat higher price. Have not seen an ad for this unit for ages but I'm sure there are still users of this thing out there in netland.

Emulators are technically very interesting, and some (such as Dave Small's Spectre GCR Macintosh emulator) are truly amazing but... there is _always_ a tradeoff of some sort. Others will offer their advice, but I suggest that if you intend to do a considerable bit of PC work (whether it be programming, games, or whatever) that you should seriously consider buying a used or even a new PC. Prices have fallen drastically and a new or used 8MHz or better AT clone won't cost you that much more than a good AT emulator for your Atari. IMHO, PC emulators are great for very occasional PC work and the "gee whiz" factor but if your needs/uses grow, you will be better off with another box to compete for room with your ST.

And I won't even _mention_ the future GEMULATOR option for fear of flaming arrows being aimed my way!!! :)

>Get real, Atari will discontinue the Mega STe by the end of the year.

I assure you, Len, I _am_ real. And unlike others, I _try_ to be polite, even when I have a dissenting opinion. It doesn't cost any extra, you know? Still, you are likely correct about Atari discontinuing the MegaSTe (and the TT for that matter) but I think by the "end of the year" is a little quick, IMHO.

>It will look like nothing compared to the Falcon 030.

Yes, the Falcon 030 will "blow the doors off" the MegaSTe or any 68000 based unit.

>Look for a faster Falcon 030 maybe at 33 MHz and a Falcon 040 at 40 MHz.

This is just precisely the "higher end" machine I was alluding to. Even so, I would caution everyone not to dump their current machines until you see the new units on the dealer's shelves. The MegaSTe is a great computer in it's own right.

I wired a cable in order to hook up a NEC Multisync GS2 to my 1040.
I had a switch to toggle between hi-res and med/low res. I've seen
a $50 box that is commercially available (check old START issues)
that does the same thing - allows multisyncs to hook up to the Atari
and has a switch on the front to switch resolutions.

I'll see if I can find the wiring diagram. If I find it I'll post it.

Shiv

First, thanks to all who responded to my PC-DITTO post.

Regarding PC emulators, most of those who responded
recommended either AT-SPEED, PC-SPEED or SUPERCHARGER.

For those of you who have used one or more of the
above -- what's the good news, and what's the bad news?
I welcome any and all information, opinions, factoids
and rumors.

The current version here in Germany is Rufus 1.11 Rel. 8 (and Rel.9
probably coming soon). rufus110.lzh seems to be a test (?) version
released a couple of months ago without docs.
The current version is shareware for 40,- DM (Deutsche Mark, about
25 US$) and contains docs (but probably in German only).

5568. Where can I find a CTS/RTS patch?

Newsgroup: comp.sys.atari.st
Date: 1992-05-27 17:18:55 UTC
From: lombardo@odin.unomaha.edu
Message-ID: <lombardo.706987135@odin>
Source record: 221656

Several users have suggested that I get a CTS/RTS software patch so I can use my high speed US Robotics 9600 v.32 modem with Tos 1.0. I have ftp access, but I have no idea where to start looking. I checked the telecomm directory at atari.archive, but there didn't seem to be anything there.

Thanks in advance.

(Please send replies via email, as I do not have Usenet access every day...)

I have an SST in my mega 4 and if you have a socketed 68000 it is a trivial installation. Just unplug the 68000 and the TOS ROM chips and plug the SST into the socket. Just make sure if the socket is an ICD Adspeed that you remove the ICD miniboard and not just take the 68000 out of the Adspeed I'm very happy with SST, it effectively has an 8 meg cache, and really hauls. I'm presently running with a fairly slow 20 meg chip, but its lots faster than the AdSpeed, currently shopping for a 32 to 40 meg 68030 set. They don't seem to be _real_ common in volume one.

Ian, I'm sorry you had what appears to be an unsatisfactory Rising Star experience. I've known the owner, Doug Hodson, for close to ten years (he and I and Fred Koch and others started what is now a pretty healthy users' group here in Dayton in 1983). His support of Atari products and users has been unswerving. As can easily be seen from his prices, profit is not the only motivation for Rising Star.

If you had so much angst over your order, he probably remembers it, too. I'll see if I can get him to respond on the net.

I don't have any financial connection with RS, but I couldn't stand seeing the folks here get such a biased impression of a business (and person) I respect.

There ain't that many left!

> HSC was not installing JAS
> The problem is you need more than 732k of free memory to install

Not true! I *never* have that much free memory. I did all my testing of the install program in my normal memory configuration, about 400k free. I figured testing it that way would ensure that it'll work for folks with 512k systems. I'd suspect that something you removed from the system (Gemini or something) was interfering with the unpacker, maybe.

> the packing technique in this archive is NOT VERY ROBUST

Well, I can't argue with that, I guess. I just used off-the-shelft tools (LHARC 1.3x, SFX.PRG) to create the self-extracting files. I REALLY REALLY wish source code for extracting -lh5- files was available, then I'd just code the extraction in INSTALL.PRG and do away with the self-extracting stuff altogether. I have my own source code for generic LWZ compression/uncompression, which I've been tempted to use, but it won't pack nearly as tight as lharc, unfortunately.

The big problem is keeping everybody happy. The whole point to HSC is that it installs and configures itself; you don't have to be a unix-head techie to get it up and running like you did on the older Sozobon releases. I've gotten a fair number of compliments from folks on the ease of installation, but I've also gotten some complaints, mostly from folks who are very technical, and want control over the installation process manually, or don't want to use a gem program to do it. I

I'm open to any suggestions on packing formats I can use in future distributions. The only requirement I have is that I must be able to invoke the unpacking programmatically (from INSTALL.PRG) without relying on extraction tools that the end user may or may not have. If you have source code for a reasonably-tight packer/unpacker, or other helpful suggestions, please send me mail.

You might want to try the D.E.K.A. adaptor.
In addition to permitting an IBM-style extended keyboard to be connected to
an ST, it has:
Joystick/barcode scanner support built-in
Advanced Motorola 8-bit Microprocessor controlled
MOUSE & Joystick port
Modular keyboard connector that attaches to all ST, MEGA, MEGASTe, TT
Optional internal Ni-CAD battery-backed clock
****Try purchasing from mail order or a retail store****

NO!!!! DO NOT use meths or white spirit or any other solvents.

If you do you'll permanently damage the surface of the case and make it
pick up dirt more easily.

Use a water based cleaner if a soapy cloth won't clean it.

One that I use which works very well on just about any surface waithout
damaging it is called 'Multi' - It's made by the US company Johnson.

I don't know whether this available in the UK.

Message-ID: <2A241E7D.4974@noiro.acs.uci.edu>
Source record: 221669
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have a 80MB SCSI hard drive w/ICD Host adaptor. I ran CleanUp ST on my D partition and it showed that some of my files had bad characters. The files were located only in 2 subdirectories of the root and the characters in the files were changed from upper case to lower case (eg. CC.TTP -> cC.tTP) while some files were named: llllllll.lll. Plus, some of the directory data within the 2 subdirectories of the root was corrupted. Has anybody ever came across this problem and knows what causes it. I'd like to avoid this situation again.

I eventually just killed the 2 directories, copied the other directories to another partition and zeroed the D partition; then I put the other directories back (the 2 bad ones I can recover from floppy).

Other pertinent info: TOS 1.2; Running NeoDesk 3.02.

The only thing different from my normal usage is that I recently tried out the XCONTROL.ACC for awhile (any connection??).

Any help is appreciated,

I know this is a shot in the dark, but wonder if anyone is out there
frustated that older progs won't work on the MegaSTe and wishes to trade
for an Mega ST(no e) computer? I am interested in giving a very good
system in trade for some type of MegaSTe system, as I would like to get
the 68881 and have at least the 16Mhz cpu... so... here's what I am offering:

Mega2 ST upgraded to 4 megs
PC Speed board installed!
Conner 44 Meg hard drive
Syqyest 44 Meg removable hard drive (3 carts included)
ICD adSCSI+ host adaptor
Color and/or mono monitors
Much software with docs.

If interested in a trade (or possibly even a straight out buy) let me know.
and maybe we can work something out.

I don't think that Motorola has come out with a 40MHz 040 yet, so I doubt that will be possible. However, I do agree that a 25 or 33 MHz 040 would be logical (However, this is Atari....hmmmmm....). A 32/33 MHz 030 Falcon would be nice (especially if it sold for less than the TT!!!), but I don't think that it would be enough of a Technological improvement to realy stimulate business for Atari. It my belief that they will have to come out with a 040 model or they will stagnate past recovery. It certainly would make those UNIX WiSH windows fly! Of course I'd be happy enough with Multi-TOS...

> modem.

Roland I do find Rufus VERY BUGGY, I did get version 1.1
at the week-end and found problems with the dialer, hickups/lockups
and there is no medium resolution support now for the ST/E, mono only.

I also got the newer German one from Stuttgart to_day, same Bugs
and one more the dialer does not drop the dial icon and can cause
the display to go into a Busy Ok loop, turning the modem off did not
clear this fault..

I can't find a way to stop the dialer, also very pore VT100 support,
I connect to a Vax that draws Boxes on the screen, but not with Rufus..

May be one day Rufus will get Fixed, but at the rate its going that will be
forever...

This Rufus version 118 looks like its just intended for the TT, no one buys the
TT here they are far to dear, they are even dearer than a 486 complete,
but the TT here does not even come with a monitor or a 1.4 meg floppy
drive...
and some of the othere News screens are stuffed up...

I'm not aware of any PD or ShareWare stuff that'll go into that detail
(though there just may be...), but the KCS Omega II (coupled with the
TIGER editor) will do just that graphically and easily via bars and
velocity stems. I hear that Cubase is better at event handling though.
There may be a demo version of Tiger or Tiger-Cub up on atari.archive,
but if there isn't, e-mail me and I'll try to transfer it from my BBS
(the unreliable bbs -- NV/USA :-) to atari.archive.

I've been working a lot with the KCS demo stuff and like it a lot, but
I think it lacks some editing features with some of the controllers.
(ie. Moving pitch bends/sustain pedals WITH the notes -- am I being a
dunce, or is it the demo???) I DO LIKE the Tiger Editor though!!!

I'm currently on the track to buy KCS Omega Level II, but am waiting
until I can see something with Cubase before sinking between $350 to
$450 into these programs. I was also thinking of getting CREATOR
(coupled with the PolyFrame Editor), but I cannot find any info or
demos on it either. Current thoughts: Cubase or KCS Omega Level II.
LOTS of people have replied in favor of Cubase, and then Omega II on
one of my previous posts.

BTW: Does anybody know if there's a demo version of Cubase, or if there's
anyone near Reno, Nevada, USA that is using it (ST/Mac/IBM/Amiga/Other)?
If I can see what Cubase can do (and how), I'm sure I would buy it...

Funny you should ask... I just got the "working" patch today.
Apparently it's been on GEnie since Monday, and at the Ottawa NCAUG
meeting, local developer Eric Rosenquist appeared quite jubilant as he
announced the recent release of this program.

Apparently, there is a problem with the interrupt structure on the ST,
so that while the RS-232 port gets priority for some purposes,
sometimes the keyboard/mouse get their fingers in, messing things up.
(There is probably a FAR better explanation than this... I think Eric
is sometimes able to get Usenet access, and he'll probably give a
response!)

Anyhow, I'll be putting up serialfx.zoo on the beloved
"Terminator"/atari.archive.umich.edu, in /atari/new/serialfx.zoo
within the next few minutes, and it will eventually migrate to the
telecomm directory. It includes: 1) Program 2) Dox 3) CPX (Controls
whether the port is locked in RTS/CTS mode or not... Important for
users of Flash, I understand).

Well, I use a watered down mixture of Simple Green (a normal house-hold cleaner/grease remover) on all of the not-likely-to-spill-into-the-machine-and-blow-it-up areas while I clean the sensitive areas with denatured alcohol. The great thing about the alcohol is if it spills on even the logic board, there is no real problem - it'll just evaporate in a few minutes. I wouldn't highly recommend using the alcohol on the whole machine as it is rather "odiferous" but it can and does work - just hold your breath. :)
But as someone else pointed out, beware what you use - your keys might get a few inches shorter, although I am sure you can make some interesting acid effects on your computer ("Yes, those are stylized whipping marks to represent how chained, how bound, how imprisoned my computer is.", "Isn't that computer abuse?")

:)

I am interested in the Pure C compiler, formerly Turbo C. Fans of Pure C
are invited to email me their opinions regarding the following:

1. Is it fast?
2. How fast?
3. What is your impression of the debugger?
4. Can you set breakpoints with the mouse?
5. Will all features work on a 2.5 MB system?
6. There is no question 6.
7. Can you build the MiNT libs with it?
8. Can you use your own editor in the IDE?
9. Can you use GNU make in the IDE?
10. If not, how good are the editor and make facilities?
11. Can you launch the compiler from a CLI, or does it have to
be run from the desktop?

Thanks for any and all responses.

Hi fellow atarians,
quite a while ago I copied the AVS-player from the atari.archive. Since I got
a few selfmade seq-animations and a lot of ftp-ed spl-samples I would like
to combine them to a AVS file. Unfortunately I wasn't able to understand the
script language (tick? tock?) and my efforts weren't very successful. Is there
a kind of manual for the AVS-player or could anybody post me hints and advices?
Thanks in advance!

Sorry "HUTCH" but these emulators are made in Germany not by ICD as you state,
unless they now have a licence to do this ..

Most of the better game require VGA, the only one that does this is the
TurboCharger, but that ends up dearer than a 386 PC...

Source record: 221679

Could some one E-mail me the address of Atari Corp. in the UK and the USA.
I am in a mood for having a constructive criticised moan at them and
to tell them to get their arse in to gear (!).

Basically I wanted to moan about Atari's attitude to its users. To me
Atari 520 & 1040's look like going the way the Spectrum 48 K went. It
had a few upgrades like the ST has but then gradually died as software
houses stopped producing for it (a bit like the ST) This of course is
mainly games as the "business" software is looking very nice.

Atari should have produced STE only software years ago with the machine
as it almost seems to late. (RE: STFormat and news report of Atari Corp.
buying coin op rights for the STE only, no other format and high spec games)

Anyway I'm sure one letter won't do anything but I'll have a go!

Thanks for the addresses, (no flames !)

Why bother cleaning your ST at-all - if you need to use white spirit or detergent to get the dirt off then it's not going to come off over your hands anyway.

One of the few good things about the ST's keyboard design is that it is very difficult for dust to stop it working. What is more the metal shield and ventillation slots underneath mean that you can actually pour drinks over it and the liquid simply comes out the bottom and makes a mess on your table. I know this because I accidently spilt some water over my STFM and got very excited about the prospect of getting a STE as a replacement on our new-for-old contents insurance, only to be disappointed :-(

Fwd From: NewZealand Atari Chat
Subject: ACCOUNTS PROGRAM

Does anyone know of a simple accounts program to suit a small
business, specifically an electrical contracting business, ie
Simple invoice printing
Accounts Recievable, Accounts Payable (aged accounts not essential)
GST must be included
Profit and Loss
etc

Also any program to assist with the preparation of Quotes ie similiar
to the 'Trader' Series on PC

Also any simple program to produce schematic drawings (not full CAD)

Efficiency, simplicity and ease of use are the main features I am
looking for (after doing the job I need of course)

Thanks

SERIALFX (Serial FIX) is a follow-up to TurboCTS by the original author (Bill Penner). Like TurboCTS, it is an AUTO folder patch program that replaces the RS232 handler in TOS for the main ST modem port (Modem 1 on MSTe/TT). Unlike TurboCTS, it works with all TOS versions (1.0 through 3.06) and fixes the one problem that TurboCTS had where it would sometimes still miss a change in CTS state.

My brother and I helped Bill beta test SERIALFX, and for the first time ever, my brother was able to do error free uploads with his ATI 2400etc/e modem (which really taxes CTS handling since its internal buffer is only about 512 bytes!).

During the beta testing I had some discussions with Bill about a different problem with the TOS RS232 code that I've been griping about since '87: the RS232 Bconout() and interrupt-handler code switches to interrupt priority level 7 whenever it needs to enqueue or dequeue a character from the buffer. At high baud rates, this results in the machine spending a great deal of time at IPL 7, which leads to some nasty side-effects. At IPL 7, almost all other interrupts are disabled, so TOS will often end up missing things like the 200Hz tick interrupt or data from the IKBD chip (which handles the keyboard and

mouse). If part of a mouse packet gets missed, the result is usually a phantom "stuck-key" phenomenon, since the remainder of the mouse packet looks to TOS like a "key-down" message for which there will not be an eventual "key-up".

I proposed a solution to Bill involving the use of a semaphore and the 680x0 "test and set" instruction to guard access to the queue rather than using IPL 7. He incorporated the code into SERIALFX, and I'm delighted to say that it works like a charm. In the tests that my brother and I have done, we've never gotten a "stuck-key" while uploading at high speeds, and the 200Hz tick counter seems to be getting serviced also (STalker reads the tick count to do timing, so if ticks get missed it makes it look like time is moving more slowly than it really is and things like CPS calcs get thrown off).

In short, if you use the serial port for anything (even printing), get this patch program. The elimination of the IPL 7 code makes it worthwhile even if if you don't need the CTS portion of the patch.

5600. A request.. to those nice people who port GCC

Newsgroup: comp.sys.atari.st
Date: 1992-05-28 14:20:28 UTC
From: ucacmsu@ucl.ac.uk
Message-ID: <1992May28.142028.41897@bas-a.bcc.ac.uk>
Source record: 221691

I grabbed GCC 2.1 from A.A a couple of days ago, I set it up.. it works fine except for a few niggles...

(1) It did not have the TT RAM flags set in the executables' headers.
(2) When running under MiNT on a Minix filesystem it got rather confused when it came across long filenames, and refused to output anything with a capital letter in it's name.
(3) On a Minix filesystem it does not set the executable permission on the compiled program.
(4) When gcc-cpp.ttp is asked to include a file on a minix partition with either a long name or something with a capital letter in the naameit goes into an infinite loop giving the same errror message, something like:-
file.c:linenum:error n pre-compiled file.

(1) and (3) are true niggles.. I can get round them easy. (2) and (4) are more of a problem, I've been recompiling gcc-lld.ttp and gas (and hit both (2) and (4) trying to do this!) and now I've found I've got to recompile cpp too!

Both (2) and (4) would probably been avoided if GCC were compiled using the MiNT libraries, it would also have made them useful when the MultiTOS filesystem comes on the scene. A mod to ld to try to set the executable permission would be a good idea too.

5603. Hard Disk Problems (Losing Data)

Newsgroup: comp.sys.atari.st
Date: 1992-05-28 14:58:48 UTC
From: "Gerry O'Rourke"
Message-ID: <1992May28.145848.20576@nt.com>
Source record: 221602

I have a problem with my Atari 1040FM + Hard Disk that someone may have encountered before. The disk is a RHODIME RT300T, connected to a Supra adapter. I am using Version 3.11 of the driver software.

The disk is partitioned into two 16 Meg & one 10 Meg sections. Things were fine until partition C: began to fill up. I noticed that files I had copied onto C: last month were missing when I looked a few days ago.

I had previously used Reorg to compact & reorganise the partition. This gave me no problems until there was about 7-8 Megs on the C: partition, when Reorg freaked out & thrashed the FAT. I re-formatted the disk & copied the files back. Now i find that utilities I used last month are gone.

GET INFO reports that there is 8.13 Meg used, with 2.9 Meg free. I used DLII to check the partition & it reported that the directories were bad. It also found 1552 lost or crosslinked clusters. It looks like the files are/were there, but the directory entries were wiped over by new files. When I tried to recover (using DLII), the prog reported that there was not enough entry space?.

Is there a known bug with the Supra software that causes this problem? I have tried to get newer versions of the Supra utilities, but Supra are really hard to contact, & I can't find them on any sites.

I am using TOS 1.2, are there known bugs which can cause this ?

Please post all replies here, as I don't have an E-mail address (yet).

Regards

Gerry O'Rourke

>I have found a cheap PC hard drive that is 130 megs (14 ms) and about
>200 pounds brand new. It has a SCSI adaptor on it I think.

Check this out carefully. If it is SCSI, then everything is great.
If it isn't, then things are not so happy.

>Q: All I need to connect it is a ICD Host adaptor from my Atari STE
>???

Well, you'll need to have a power supply for the drive, and make sure
that there are enough cables (the drive ought to include a cable that
connects it to the Host Adaptor. A power supply will include cables
to connect power to (a) Drive and (b) Host Adaptor).

I wound up picking up an old PC case with power supply for about $100.
(There's actually a motherboard in the bottom, with a "real" 8088 in
it. Completely worthless, which is NOT an Intel bash - but rather a
simple statement of fact. Who would buy a 10 year old XT motherboard?
That's not necessarily compatible with anything?)

It has a fan, a power supply, space for 4 hard drives, and enough
cables & plugs to connect 5 or 6 drives to the power supply.

>Q: Is there any Public Domian software for formatting and general set up ???

Haven't seen any. If you get an ICD Host Adaptor, you'll get some
very good commercial software that does all of this stuff. Actually,
it appears that ANY of the Host Adaptors include this sort of
software.

>A: I have seen an ICD Host adaptor for about 70 pounds which would still
>mean the hard drive around 150 pounds cheaper. Is it all viable ???

You'll possibly have to pay a little for the power supply and case.
The idea is still pretty viable. And the assembly process is really
quite simple. Took me about half an hour, but that included poking
around to take the PC apart, and generally having fun with that.

(By the way, that 70 pound price seems to be about right. The local
price in Ottawa is about $170 CDN, which corresponds approximately to
70 bounds. They must not be putting TOO high a set of duties/taxes on
the Host Adaptor over in the UK.)

This sounds great. I've had problems with zmodem uploads using my
Supra 2400plus (v.42bis, aux port locked at 9600) because of buffer
overflows, and I've tried most of the other serial-port patches out
there, including TurboCTS, without success. I'm ordering the fix from
BART right now.

PP> found the hard drive utilities disk and booted the system up w
PP> the hard drive will automatically take over and boot up from
PP> drive. Help!

If you can get hold of a program called SCSIWAIT, your problems
should be solved quite easily. The program makes the hard disk
wait until the computer has booted so you haven't loaded any auto
programs from the hard drive.

If you're hard drive has to power up before booting, try turning on
power to the drive and then imediately turning on the computer. This
should give you a boot from floppy with the ICD host adapter online
bootup, without the hard drive taking over.

If that doesn't work your next best bet would be to open up the case of
your hard drive (void waranty), and unplug the power connecter to the
drive only (leave power on to the host adapter). Turn on the power
to the host adapter and computer as usual. After you have run the
hard disk driver you can hook the power back into the drive and install
drive C:. Then be sure you delete the POOP loader from your AUTO
folder.
P.S.
It would be a good idea to have a floppy set up beforehand with the
hard disk driver and utilities so that it will boot off of drive A:

You're right about that! I didn't check for a conflict with any of the removed programs. I so rarely have conflicts with my setup that it didn't occur to me, and the memory thing seemed like such a plausible explanation...sloppy on my part :-)

> I'm open to any suggestions on packing formats I can use in future
>distributions. The only requirement I have is that I must be able to
>invoke the unpacking programmatically (from INSTALL.PRG) without relying
>on extraction tools that the end user may or may not have.

Maybe you've already dismissed this idea, but...
why not use arc or some such PD extractor and distribute the executable in your package? Then, INSTALL.PRG can invoke the extractor (like an arc shell would) to do all the work transparently. Even if you used some shareware extractor, I'm sure it'd be easy enough to get permission from the author. As a side note, aren't you making some assumptions by distributing the entire package as a zoo file (as on umich) or lzh, or whatever? I can understand the issue if you distribute many copies via floppy, but otherwise...?

> software.

You can get Atari's AHDI 5.0 hard disk software from atari.archive and GEnie.
I sent it to the moderator of comp.binaries.atari.st several months ago, but
I never saw it appear on the network, and people are not generally aware of
its availability. So far as I know, AHDI will work with any of the
currently available host adaptors. It even has support for IDE drives
(used by the ST Book laptop).

The new AHDI is very nice and easy to set up -- I use it in preference to
the Supra software that came with my host adaptor. The big advantage of
AHDI over the Supra software is that it works with ST-Tools, a very nice
GEM-based disk optimizer/repair/editor utility, which also should be
available at atari.archive (version 1.8).

I believe ICD includes a disk optimizer/repair utility with its host
adaptors. Supra has no optimizer and no utility for repairing broken
chains and untangling crosslinked clusters.

For one thing don't use the Long drive cable that ICD push, use a 18" one,
also get one of the newer DMA chips, Part No. C398739-001A, I don't trust the
older DMA chips Part No. C025913-38 , these are the ones that cause all the
problems with the STE...

Also turn off write caching, I also get the same problems, but these are just
my suggestions to fix the problem, you could also try a different booter,
ala Atari HDX5 or Supra, I do have some doubts about the ICD one, even though
its the best there is....

The DMA chip would be about $15us....

>20mhz 286's 386SX's, and 386's.

I can believe that an 8 Mhz 68000 can outperform a 16Mhz 286, but nothing much beyond that. You're going to have to do a lot better than just making a blanket statement if you want anyone to buy this. What applications are you running on the ST that are faster than their equivalent PC counterparts? Let's compare compiling source files using GCC on both machines, unzooing big zoo files, or something similar.

>This is important to me because I am
>getting a lot more speed out of a computer that I paid a lot less for.
>PC prices are coming down, but so are ST prices. ST's are also consistently
>less expensive.

You must not be in the same universe I am. Pick up a Computer Shopper or PC sources. You can get a 386-25 for the price of an ST now. Hell, you can probably get a 386-40 if you're willing to get a non-multisyncing monitor (like the ST has). Clones are really really cheap these days. $1700 for a loaded SVGA 486/33 is typical.

>The operating system(s) available for the IBM make it very
>difficult to do just about anything.

Oh yes, and TOS is just worlds better. Come on; neither of the machines run "real" operating systems out of the box. If you want a Unix derivative you can get one for either machine.

>For example, on an IBM, to access an
>RS-232 port from C, you need a set of libraries that MIGHT NOT work with
>all RS-232 cards or modems, while on the ST, you just make simple OS calls.

Libraries? The ROM BIOS calls provide access to the hardware, including the RS-232 ports. The C calls are just wrappers for the BIOS calls, in all likelihood. As for incompatibilities, you'll have to substantiate your information. I've never heard of widespread problems like that. SVGA graphics, yes. But with RS232 access? I don't believe that.

>I've dabbled a little in GEM programming, and it's really not all that
>difficult, whereas Windows programming is horrid. A friend of mine showed

>making his program nice.

Aren't you being a little bit biased here? I just don't think you're looking at *any* of this objectively, which is how religious computer wars get started. No one ever said the ST was a bad computer; the claim was simply that PC's are "OK," and that they can even be more cost-effective than ST's for some things.

>(like the motorola's have all along). A 25/100 chip would not exist,
>unless you had two clocks... one for the motherboard at 25, and one
>for the CPU at 50/100.

From Infoworld, March 9, 1992, p.3:

--
"Clock-doubler Blows Into Town"

"...The Intel 486DX2 [-50] runs at 50 MHz internally and 25Mhz
externally, and gains much of its cost benefits because hardware
manufacturers don't have to build a system using extremely fast 50-MHz
parts to optimize system performance..."
--

The basic fact remains: With a 486DX2-50, you get a 50MHz processor on internal cache hits and a 25MHz processor externally. The motherboard need only be designed to run at 25Mhz. With decent cache hit rates (which we expect thanks to the principle of locality) this technique gives excellent performance without requiring expensive board parts. Whether or not Motorola's 68040 does this, I don't know, but I'm quite certain the 68000 doesn't.

>It really would not give you much of a speed
>advantage to make the CPU run at 4 times the rate of the external RAM.

I beg to differ; your chip would run 4 times as fast most of the time. "Most of the time," of course, is determined (again) by the cache hit ratio. The hit ratio could be in the 80-100% range for the 486, or it could be lower. I don't know what is typical, but the basic fact remains that clock-doubling chips are a Real Good Idea.

>Unless, of course, Intel comes up with a much less brain-dead memory
>accessing method.

First of all, as of the 386 Intel already *has* fixed the memory architecture problems, at least as far as the hardware is concerned. The 386 supports virtual memory; it has an MMU.

PC memory limitations are imposed by DOS and by pre-386 architectures; Xenixes and other Unix derivatives use the whole memory uniformly. (386 Mach, e.g., can use all 32 megs of RAM in a [34]86 machine with no problems.)

Well, since I have a number of folks wanting different parts of the system , and amazingly enough some want only computer and monitor and some want the drives.... I think I might be willing to split it up... To be honest, I would like to get $1100 for the following system. If If you think thats too much make an offer, but I think that for all thats there, its a great price. So far noone wants the package as a whole, so I am opening it up to bids on various parts... (preferably only 2 (and max 3) different splitups of it. Based on the price I am seeking, make an offer. So far I have a lot of inquiries with no money prices yet, so I shot out the number I would like to get... so give your thoughts now. I will let everyone know whats been bid so as not to waste time or play any secrecy games.

System:
Mega2 ST upgraded to 4 megs
PC Speed board installed (IBM hardware emulator)
Conner 44 Meg hard drive
Syqyest 44 Meg removable hard drive (3 carts included)
ICD adSCSI+ host adaptor
Color and/or mono monitors
IMGScan scanner (mounts on a printer)
Golden Image Mouse
Monitor Master Switchbox
STReplay sound digitizing cartridge
Much software with docs including:
Quick ST 3.0, HotWire, MultiDesk, HiSoft Professional Basic
Interlink, Dungeon Master, etc. more that I can list if needed.
Many Mags, some books, lots of odds and ends

More price comparisions, for the helluvit...

D & P computers, in Ohio (my favorite mail order, co) has a special.
For $995, you can get either A) A Mega 2 STe, with 50mb and an SC1224,
or B) A Mega 4 STe, with 50mb

(personally, if I had $1k, I would go for it!)

Take all the capabilities built into this machine: MIDI, digital stereo
8 bit sound, mouse and joy stick. VGA-quality graphics (some would
argue its EGA-quality, but since VGA is analogue, and the ST is analogue,
well, its a closer comparision). Now take in the built in OS and
desktop GUI. You got a serious machine here

Now, compare it with a comparably equipped 16MHz 286. The Sound Blaster
card alone costs $300. Monitor and card, $400. $300 for a 50mb
drive and controller. Add in OS, and GUI, and whatnot...

To me, this sounds like a good thing.

I am not bashing anything. I am simply stating FACTS. If you do not
belive me, I challenge you to put together a 16MHz 286, with
THE EXACT (or close) SAME CONFIGURATION; MIDI, video, mouse, the
serial, and parallel...

I am totally comfortable with my 520STe. I have loads of fun with it,
and it does what I want. Most of the times, next on hand is an
accerator, but I cant decide on the AdSpeed STe (16MHz 68k, at $250,
or the TinyTurbo030 at $600)

Just a bit of a disagreement here. I've been using the ICD cable
for over 4 years without a problem. Also, have used the write caching
for almost a year. No problems there unless you forget how it works and
turn off/reboot, before the write is finished.

As I recall, neither the PC ROMs nor MS-DOS provide interrupt-driven,
buffered serial port management like TOS does. (This may be fixed
under Windows; I don't know.) The author of a DOS program that needs
to communicate over a serial port either has to write
interrupt-servicing routines, purchase a third-party communications
library, or require that the user install such services with a TSR
program.

The advantage of TOS in this area is lessened by Atari's horrible
record of releasing versions with broken RTS/CTS flow control. I'm
happy to say that Bill Penner's latest effort fixes the serial driver
on my TOS 1.4 system -- I finally can upload using Zmodem.

>2. How fast?

Yes, it is blazingly fast - and it uses file caching to minimize (slow) I/O.
Benchmarking it is a waste of time: a source of 10.000 lines compiles in 20-30
seconds tops.

>3. What is your impression of the debugger?

It's not as cool as Think C's debugger for the Mac, but apart from that it's
the most useful debugger I've ever seen.

>4. Can you set breakpoints with the mouse?

Of course you can.

>5. Will all features work on a 2.5 MB system?

All features will work on a 1 MB system.

>7. Can you build the MiNT libs with it?

Dunno, but guesso.

>8. Can you use your own editor in the IDE?
>9. Can you use GNU make in the IDE?

There are two versions of all the stuff, a commandline as well as an
integreated version.

>10. If not, how good are the editor and make facilities?

The 'make' (called project) is not as powerful as normal make; the editor is
ok, and the environment has online help for Pure C, C, ANSI libs, TOS/AES/VDI
libs, and a nifty thing called 'project help': if you've compiled your file
once you can press HELP while on a user-defined function and the editor will go
to the definition of that function, etc. etc.

>11. Can you launch the compiler from a CLI, or does it have to
> be run from the desktop?

You can run it from anything.

Gr., J.

>(Someone on BIX asked me about them today -- first I ever heard of them.)
>
>

Hmm, I have a program called SPSVER.PRG which does the following:
- view .SPS, .SPC, .SPU files
- convert between .SPS, .SPC, .SPU (basically just squishes or compresses/uncompresses)
- does animation or stereo animation on sets of pictures
- allows script files

Problem is, I don't know if any of the programs on a.a are the same program. There is one called SPSLIDEX there, someone help me out and tell me if the above sounds familiar. It's a good all-purpose spectrum program, I've had it for several years now with no problems...

5623. Still having problems with Legend of the Sword - Help!!!!

Newsgroup: comp.sys.atari.st
Date: 1992-05-29 10:13:01 UTC
From: pjs0@aber.ac.uk
Message-ID: <1992May29.101301.21631@aber.ac.uk>
Source record: 221630
Cross-posted to: comp.sys.amiga.games,comp.sys.atari.st

Yes, Im still having problems with Legend Of the Sword
I didnt get any replies last time *sniff* so im re-posting....

I know its old but:

Can anyone tell me what you use to plug the boat with?
Does it matter which area you start the game in?
I destroyed the bottle of antitrolls to get a glass shard so that
I could cut myself free at the humanoid camp - was this the
right thing to do??

How can I get the Brandy bottle from Borgalius ???

Thanks in advance, Id appreciate any help,

Replies via E-mail if possible,

PJ

5624. Re: A request.. to those nice people who port GCC

In article <1992May28.142028.41897@bas-a.bcc.ac.uk> ucacmsu@ucl.ac.uk (Mr Stephen R Usher) writes:

++ I grabbed GCC 2.1 from A.A a couple of days ago, I set it up.. it works fine
++ except for a few niggles...

++ if GCC were compiled using the MiNT libraries, it would also have made them
++ useful when the MultiTOS filesystem comes on the scene. A mod to ld to try
++ to set the executable permission would be a good idea too.

Seeing as how you have a TT running minix, perhaps you could download the several megabytes of GNU sources, apply all the update patches, make the mods to ld and compile up the binaries using the MiNT libraries and then upload the binaries to A.A.

I'm sure that that would be a valuable addition to A.A.'s archives.

Cheers.

SORRY, maybe this is a FAQ (but i could not found it there):

can anybody point me to a ano.-FTP-side where i can find
a PBMPLUS-"Driver" for a HP DeskJet 500 (NOT "c"!) ?
---------- ----------
i think something like "pbmtohpdj" will do.

BUT: i need the ready-to-use TOS-file,
not the pbmplus-package or source.

>argue its EGA-quality, but since VGA is analogue, and the ST is analogue,
>well, its a closer comparision). Now take in the built in OS and
>desktop GUI. You got a serious machine here

You can get a similarly equipped 286 for about the same price. Again, just look in any Computer Shopper. (Not the ads by Northgate or Austin, but the smaller ads by the no-name clone companies. After all, it's fair to say that if you get no support from your off-brand clone company you're getting more support than you will from Atari.)

>Now, compare it with a comparably equipped 16MHz 286. The Sound Blaster
>card alone costs $300. Monitor and card, $400. $300 for a 50mb
>drive and controller. Add in OS, and GUI, and whatnot...

Even the most expensive sound blaster card is $200 now, and it has a MIDI port on it. The low-end sound blasters cost about $60. Your 50MB drive and controller will probably be 100 megs by default and would be included in the package deal. As for "OS and GUI," if you're going to argue that TOS and GEM are a reasonable OS and GUI pair, then I definitely have no problems saying DOS+4DOS (shareware) and Windows 3.1 (which is included along with a mouse in most packages) are a reasonable pair. Windows actually lets you run *more than one program at once, in windows* -- what a concept! (As I've said before, I don't even like Windows. But let's be reasonable.)

If you spend $400 on a monitor and card, you're going to get a nice multisync SVGA monitor; i.e., 1024x768, noninterlaced, .28 dot pitch, which is tremendous overkill compared to the ST's single-sync monitor. If you only want to run VGA the card will cost about thrity bucks and the monitor a couple hundred. The whole cost for such a 286 system would be between $800 and $1200, depending on where you bought it and what kind of graphics you wanted.

Serial/Parallel cards almost always include joystick ports these days, so that's not a problem.

Acutally, Roger, I wasn't sure where those emulators were built but I do know that ICD _sells_ a bunch of 'em! Oh, and the "TurboCharger" unit is actually known as the "SuperCharger", I believe with a base price now of around US$499 (I've seen it advertised for US$450 including DOS 4.01). Did they ever come out with their VGA module or whatever it was? Whatever, it most certainly is a little "dear".

Of course, it could be worse. You ever seen the PC emulator boards for the MacII made by Insignia Solutions? They include a complete PC on a board and can give the Mac user true "AT speed" (whoopee) for only around $2,500! Ouch! You can buy a 486/50 with all the trimmings for that. They also sell the SoftPC software only emulator which I use on occasion on a Mac IIci. It's still too slow for serious work (even on the 25MHz IIci) but it's only $72.

You MAY be right, Roger. But what say we wait and see what happens, eh? If Atari wants to drive nails in their own coffin, they are surely capable of doing it themselves without our help. Such statements are not likely to assist in improving Atari's sales... or is that your intent?

Are you so convinced that anything new Atari would bring out would be "crap?" Don't you think this attitude is just a tad bit pre-judgemental?

Turn off your pilot lamp, Roger, you are overeacting into "Flame Mode" again. :)

Yet have a new MAC and I think its "yeeck", I get 256 colors at 640x480 on the
MAC great!!! Yet my 486 at the same price can out perform and out do all the
rez that this d*mn MAC can do. Anyways this is the discussion on ATARI right?
Sooo as for ATARI and MACs, the MACs currently have better prices for their
machines than the ATARI does, and probably better support here in the US.
Until ATARI comes out with it's new cheaper line, MEGA STEs are worthless
when it comes up to a MAC, again locally. MAC cheapo LCs are now $1100 with
4 megs and 40 meg HD.

><ahem> I agree that PC's are more easily expandable, but consider this:
>There are some people who consider expandability to be less important than
>speed or ease of use. The Atari ST (8mhz 68000) consistently outperforms
>20mhz 286's 386SX's, and 386's. This is important to me because I am

You're wrong here, the 386SX20,SX16 running windows 3.0
is about the same speed as a 030-16 (MAC comparisons, adds from MACs)
From test runned by MATLAB, the 68000-8Mhz came close to 3 KFLOPS, the
XT 8088 w/o FPU was at 17 KFLOPS. The 030-16 was at 9 KFLOPS. The
MIPS even on the 68000-8Mhz is around 1.0 - 1.5 MIPS (MIPS to somepeople
are not consider valid for any type of comparisons!), yet the 286-16 came
in at 2.9 MIPS. Even running compilations on my ST, my (old 386SX16 now
gone) was about 10 times faster. It was actually many times faster in
all areas except some graphics which the 386 had to deal with the cheap
VGA cards. Another way of looking at this, Darek who makes the GEMULATOR
can emulate the STe on a 386 at the speed of the original STe speed (with some
software), if you say that your ST 8Mhz can be equivalent, then that means that
this emulator should be alot slower. Infact way too slow to do anything.

>getting a lot more speed out of a computer that I paid a lot less for.
>PC prices are coming down, but so are ST prices. ST's are also consistently
>less expensive. You have to pay many times more than you would for an ST
>to get an IBM compatible with equivalent speed.

To get a faster than ST speed? Well take for instance, 386SX16 with VGA,
40 Meg HD, 2 meg RAM, etc... for $700.00 new (1 year warranty)
Or get a 286-16 or 286-12 for about $100.00 less.
Try this with an ST setup and not used.

>Further, as a programmer, it is important to me to have a programming
>environment that lets me get the job done rather than forcing me do deal
>with a lot of overhead just so I can communicate with my operatingsystem.

As a programmer and a lab worker, programming simulations and data recognitions
are the most important for me. Try to capture and recognize variables at
the same time with a "faster" ST, a 386 does the job very well and fast
enough. But don't take into account that the 386 is what I use at the lab
anymore, I use the DEC station to analize the data while a new 486 is setup
to do the capturing now at a alarming rate.

>The Atari ST is BY FAR the easiest computer to program. Not only is the
>microprocessor faster, but it's assembly language is much easier to use than

The microproceesor is not FASTER. And for ST programming, for some, the PC is easier, I programmed on both. Doing simulations which in all the time, the PC 386,286 all came out ahead in compiling, and finish running. Take to account that both machines had fast Harddrives.

>serial, and parallel...
>
Your "FACTS" are not correct. Allow me to make corrections.
If we have to compare oranges to oranges....
I have found a comperable no name audio board for $150, VGA monitor for 225,
vga card for 75, 80 meg drive w/ controller for 300. Windows for < 100$.
Tack this on a 286-16 and you will have almost 2ce the speed of an 8MHz ST
and a wider range of software.
Benchmarks will prove the speed increases.

For Joe Hairy User this would be a more usefull solution. Chances are, he knows
someone else w/ one and can get help, etc from them if needed.

Most people are not hackers and don't understand computers that well.
Remember not everyone has access to the net/ or has time to work with it.
So all the useful software here has to be hunted down somewhere. J.H.U.
can just go to his local hole in the wall software store and pick up
virtually any PeeCee program he wants.

Granted Intel processors generally suck. But if you are not really programming them
it really doesn't matter does it?

>accessing method.

The main point that should be made is that you can increase the speed of the processor (internally) as much as is possible. The problem is that without a different memory sub-system, it will have to take just as long for internal speed A to get the data as internal speed B. With todays high speed processors, the majority of cycles are going to waste because it is idling waiting for the memory access to be resolved.

The "real" only way to increase the apparent speed of this type of system, is to have a large on-chip cache, with a very intelligent cacheing system.

Only if you can read english :-) (The program menus are in english,
but the online help text is in german).
As I've said before on the net, don't let the german language deter you.
For most german texts an english equivalent can be found (for example,
for the ANSI C libraries there are obvious english replacements).
For the remainder some guessing and perhaps a dictionary will suffice.

I am no wizzard in german, but it has never been an obstacle in using
the program.

Source record: 221639

There's been recent posts about RTS/CTS flow control problems in
TOS and high speed modems. My question is that is the problem
in all TOS versions? I've been using a 9600 v.32 modem and have
had no problems with Z-modem transfers. My TOS version is 1.2.
Does TOS 1.2 require the serial fix that has been posted to a.a or
is it just for other TOS versions?

>$1700 for a loaded SVGA 486/33 is typical.

Dave, are you reading the same Computer Shopper that I am? In the June 1992 issue, the average price of a 386/40, with 4 megs of memory, an 80 megabyte hard drive and an SVGA monitor is $1600.

On the other hand, a 4 megabyte STe with 4 megs of memory and an 80 megabyte hard drive comes in at less than $1000.

Of course the 386SX computers are a bit less expensive, but even the folks at Computer Shopper don't recommend it to anyone except those who need a 'minimal' starter computer.

-- David Paschall-Zimbel

(P.S. I've been disappointed with the pricing of bare hard drives advertised in Computer Shopper. When a 40 megabyte SCSI drive actually costs MORE than a 50 megabyte drive advertised by E. Arthur Brown [which includes the host adapter...], something's wrong.)

>I am a reasonably good searcher... (yes, I tried archie :-))

I know that it appeared in either ST Format or Atari ST User. (Since I get both, and they're at home and I'm at work, I can't be more specific.)

However, just because a program is released on a cover disk does not put it into the public domain. For one thing, it still has a copyright on it, so, at best, it would be is called "Freeware". For another thing, most of the copyrighted programs appearing in magazines are licensed to whoever buys a copy of the magazine -- they are not freely distributable to anyone else.

>gives excellent performance without requiring expensive board parts.
>Whether or not Motorola's 68040 does this, I don't know, but I'm quite
>certain the 68000 doesn't.

The 040 works in a very similar way to the 486 (not 486D2) where 1 clock
cycle externally = 1 clock cycle internally. Note: the 386, 030, etc both
have 1 clock cycle externally = 1/2 clock cycle internally.

>
>>It really would not give you much of a speed
>>advantage to make the CPU run at 4 times the rate of the external RAM.
>
>I beg to differ; your chip would run 4 times as fast most of the time.
>"Most of the time," of course, is determined (again) by the cache hit

...Most of the time....?

Welcome to the real world:

*** On an processor internal cache hit.... Yes, fast. But internal cache
is big bucks for the amount needed to make the machine run smoothly.
486's have 8k internal, at any rate, it takes longer to do a "burst"
fill than it does to execute the instructions. If a fill is requested
the processor has to idle while its data bus is used to fill the cache.
This really kills things. Wouldn't it be great to have an on-chip cache
controller with it's own data bus to "take care" of the mess?

*** On an external cache hit, or memory access, it would feel like
running at the CPU board speed. PERIOD. This is more the case
than the above is. IE: the processor
has to set the address, read/write, etc. and wait for the next
clock to come around for the external hardware to receive the request.
On a processor with 1 cycle instruction times, every non-internal
memory access will still take 1 external cycle(for the execution of the
instruction, and the idle waiting for the next external cycle to
arrive) + number of cycles for each memory access.

It's not that I'm against the idea of internal speed doubling, I do think it is
a good idea, but I don't think the performance increase warrants the big deal
that is being made of it. (Extra price doesn't make me feel better either.)

It would be trivial to write a benchmark that would show a 100% improvement,
as it would one that would show no improvement.

The speedup that is achieved depends on __what is being run on the machine__.
How often does it come back to this???????
I have seen reports of anywhere between 5 to 30 percent. Basicly from Aaa-Choo(sneeze)
, to wow almost impressive.

Source record: 221643

Posted for shammer@mafalda.math.mcgill.ca:

Hello all. I wanted to know just how 'easy to use' are FAX programs
for the ST line. Are there any that have the following features?:

- The program can sit around just waiting for incoming
FAX transmissions from faxmodem (like Supra's new one).
and save them somewhere. (like hard disk)

- Lets you look at all the FAXes you have received, and
print out the ones you want.

- Lets you send faxes easily.

- Can send faxes scanned from flatbed scanner.
If it has to be done through another program, is there
an easy way of doing it?

Thanks. It is for a painting business that needs a computer and also
fax capability, so I figure go for a good modem, scanner and printer,
that can be used for other purposes as well.

Let me know your thoughs, please!

I already own one. Its the machine I am posting to now. I dial into
it thru my STe. Along side my VAXen, which to me, is more 'real' than
the ST or PC. But that is MHO...

>For Joe Hairy User this would be a more usefull solution. Chances are, he knows
>someone else w/ one and can get help, etc from them if needed.

I am realistic in that sense. My vision of the Atari world is MIDI people,
and DTP. The PC world has more software off the shelf than the ST, but
I still wont and never plan on owning a PC. I work on a PS/2 at work
and that just solidifies my personal opinions...

>Most people are not hackers and don't understand computers that well.
>Remember not everyone has access to the net/ or has time to work with it.
>So all the useful software here has to be hunted down somewhere. J.H.U.

>Granted Intel processors generally suck. But if you are not really programming them
>it really doesn't matter does it?

I think that the architechure of the processor is important. Granted, I
consider myself a hacker. I like to make the comparision, its not good,
but it does get my view across:

Take a Ford truck (F150 perhaps), and take a Mazda Miata. The truck is a
work horse, and will pretty much run forever. The Miata is a sleek,
expensive sports car, not much utlitity... Which would I rather own? :-)
I said this isnt a good comparision, but you get the idea. The Atari
may be more expensive (I still dont belive so), but it certinally is
more exciting than a PC..

Once again, all IMHO. If a clueless person were to ask me what kind of
computer to buy, I would point him at a 386SX...

>

Are you comparing a Mega STe to a 386-40??? That's a little off the scale
isn't it? Come on, let's put a more comparable ATARI machine to a 386-40
such as the TT. Your comparisons also lack the fact of rez and that the
386-40 comes with a SVGA monitor and also a higher density drive. I know
that the 386-40 lacks MIDI, but pop in a $189.00 SB pro, your prob is solved.
By the way, a 386-40 for $1600, I wouldn't touch it since a 486-33 is at
$1700 new with 120 megs instead of 80 and is here locally.
Your price for a new Mega STe with 80 megs is good, where can I get this
new at for less than $1000.00?

5656. Unix-like utilities

Anyone know where I can get such unix-like commands, such as ls(.ttp),
and others? Im running MiNT and Gulam, but I dont like Gulam having
all the commands built in, and would rather have them as executables
(so I can run some of the stuff as a MiNT bg process)

Thanx

Source record: 221451

.SPS stands for 'Spectrum Smooshed' files. Which is a form of compression for .SPC or .SPU Spectrum 512 pictures, which is a LOT better than the compression used by .SPC.

The file itself is less than 10k. (SPSLIDEX.PRG is the filename) it's available on GEnie, and most probably on Atari.Archive or another FTP site.

It has options to view .SPS, .SPC, or .SPU pictures, using script files, one by one, display the filenames, support for .SPS animation files, and 'Stereo' pictures. (which I think is 2 picture screen flickering - to give 1024 colours or something like that)

You can also, of course, 'Smoosh' or 'Un-Smoosh' Spectrum picture files. (Compress or De-Compress basically)

Maybe there's some kind person who has the proper .LZH or .ARC file (or whatever it is) - that could upload it, as if you have a LOT of SPC / SPU pictures, it can save A LOT of disk-space (up to 50% compression of the file size on .SPC pictures!!)

Most major cities have places that will convert PAL to NTSC
for you. Check the yellow pages. I doubt you'll ever see an
NTSC version, given European developers attitude towards the
North American market.

>Yeh, Mac prices have come down but they are still a far cry from being cheap!

Connecting Point, COMPUSA, BIZMART and another one I can't remeber are all here locally, they are selling the LC II 4/40 for $1349.00 and even at CU Boulder, they are cheap with Student Discount (don't know how much student discount is though). Saw MAC LC for $1099.00 at COMPUSA, I think BIZMART also.
As for dealing with Mail-Order, who needs it if the prices in Denver are sooo cheap. Think of it, a 486-33 with SVGA, 4megs, 120meg HD, for $1700.00 and is here locally.

>(Otherway round it really didnt work !!!)

Even with TOS 1.06, I ran into problems like this also. I "solved" the
dilemma by formatting the diskettes with DC (Double Click) format on the
Atari using 80 sectors, 9 tracks in skewed mode.

5663. programs for TT only

Newsgroup: comp.sys.atari.st
Date: 1992-05-30 09:01:22 UTC
From: erlingh@idt.unit.no
Message-ID: <1992May30.090122.19555@ugle.unit.no>
Source record: 221463

Hello world.

I have ported a bunch of programs for mint+tt, mostly gnustuff.
Well, not actually ported all of them, some are only recompiled
with mintlibraries, others I grabbed from the unixdistribution and
compiled without diffs at all :-)
Some needed a few hacks though...
Now I was wondering whether I should upload this to atari.archive
or not... the trouble is that the programs will only run on TTs
(or accellerators with 68030/68881) since they were compiled with
-m68030 -m68881. (Why not take advantage of what one has :-)
All programs are compiled with mintlibs and therefore uses minix-
filesystems/long names without trouble. No UNIXMODE.

The programs are:
program comments
==========
gcc-2.1 /* all patches applied */
/* gcc-ld does chmod +x */
/* adds fastloadbit and TT-ram bits */
/* Has -m68030 -m68881 as default */
gnumake 3.60
gnufind
bash-1.12 /* uses .bash_login .bashrc etc. */
gnu-shell-utils test,expr, etc.
gnu-text-utils cat etc.
gnu-fileutils cp,mv,ls etc.
gnu-grep/fgrep/egrep
gnu-sed
gnu-emacs 18.57 /* with M-x compile, M-x display time etc */
gnu-nroff (groff)
gnu-compress
gnu-tar /* Understand -z --> forks off a compress prosess */
gawk /* Compiled without ST-hacks, pretended to be BSD */
bison /* ditto, uses .tab.c style */
flex /* ditto */
gnu-m4 /* ditto */
less /* Understands (as emacs) SIGWINCH */
mgr /* NOT using line-a + assembly-scrolling == much */
/* faster mono-only (ST-HIGH,TT-HIGH) */
diff/patch
berkeley make
berkeley sh (ash) /* Finally fixed job-control */
elvis /* without st-hacks. Pretended to be BSD. Understands
termcap (big screens/mw/mgr etc.) */

As you can probably guess these programs fill up quite a few megabytes,
and I don't think it is much point in wasting bandwidth/diskspace if
there are only very few people with TT's that are interested.

Send me mail, and if I get enough interest I'll upload the binaries.

5668. A320: problems with NAV1

Newsgroup: comp.sys.atari.st
Date: 1992-05-30 16:49:50 UTC
From: reynolds@panix.com
Message-ID: <1992May30.164950.5897@panix.com>
Source record: 221471

I am having trouble with the A320 Airbus simulator. A few weeks ago, during a discussion of problems with the pilot's log, someone mentioned that the keys for adjusting the radials on the navigation radios are 'z' and '\' for NAV1, and 'Insert' and 'Clr/Home' for NAV2. Although I can now adjust NAV2 (thanks) I'm still having trouble with NAV1. 'z' increases the radial displayed, but '\' does nothing. I have tried every key on the keyboard, except those that are listed as having another function (all of which I have verified do perform the indicated functions). The text of the manual and the appendix on command keys (Appendix A) conflict as to what keys are supposed to adjust the radials. The appendix for my version of the manual seems to have been written for the Amiga (although the Atari is mentioned in the text). Does anyone have a version of the manual with an appendix for the Atari? Other than by trying every key, how did people know which keys to use to adjust NAV2? I have a yellow insert that mentions changes with respect to using the auto-pilot and scoring, and how to copy the disk on an Amiga, but no corrections for the Atari.

Thanks in advance,

> know where to start.:) Only thing left to do is waiting to see what
> actually appears.

Somehow the saying "showed the Falcon publicly only to developers..."
sounds like something of a contradiction! <grin> Sorry, couldn't help
myself there!

Here's the scoop; we showed it to dealers and developers at CeBIT in
Hannover, Germany. We showed it to dealers and developers at ACE '92 in
Toronto. We've shown it privately to developers on numerous occaisons here
in Sunnyvale. And as we indicated before, we began shipping to developers
in April. We are still shipping machines out to them now.

Re who to "blame" for the leaks; dealers & developers, and users! It's
just like playing telephone. A dealer tells his customers, who tell their
friends, who add their own "gee, I hope it has..." features to it, and
they tell their friends AND add *their* own wish list, and so it goes!

regards,

Bob Brodie

Unix for the TT has been shipping for *ages*. In the UK it's been available
AFAIK since about January and in Germany even earlier. You buy either a TT
with the SVR4 on it's HD or buy a big HD with it all loaded. I've seen it
and it works fine! It runs mono only xwindows though :-(
It comes with good development tools, screen designers etc. There is already
commercial software out for it.

I have normaly no problems to portate discs for atari to pc or vice versa.
Even discs with 82/10 are readable and writeable on pc, the only thing I
normaly use is PCTOOLS 7.1 for copy. I would try it ...

Best .... Micha

DS> 1. Is it fast?

YES!

DS> 2. How fast?

Slower than a C compiler on a SUN630MP, faster than MWC ;-)

DS> 3. What is your impression of the debugger?

It makes the package. While there are a couple other fairly good C compilers, none have a debugger as good as Pure's. Too much to describe.

DS> 4. Can you set breakpoints with the mouse?

Yes!

DS> 5. Will all features work on a 2.5 MB system?

Yes! Of course if you write some huge program, you may need more.

DS> 6. There is no question 6.

Yes anywho!

DS> 7. Can you build the MiNT libs with it?

? I haven't tried to, if they are pure ANSI C, I don't see why they shouldn't.

DS> 8. Can you use your own editor in the IDE?

Yes. You can either use the built-in editor (nice because if you make a mistake, you can double-click on the error in the error window, and the editor will jump right to the code), or an external one.

DS> 9. Can you use GNU make in the IDE?

??? Whats and IDE, besides a type of low-power drive interface.

DS> 10. If not, how good are the editor and make facilities?

VERY good. And very stable. Even the debugger (single-stepping the assembly instructions watching the CPU registors) works under MultiTos.

DS> 11. Can you launch the compiler from a CLI, or does it have to
DS> be run from the desktop?

GUI or CLI, take your pick.

I looked at this software as well, and it looks good. Anyone know where I can get (or a good source to check out) new/used 150Mb QIC tape drives, or other good SCSI tape drives (inexpensive DAT drives maybe)? I need to make better backups, but backing up one 213Mb drive, and two 65's isn't exactly fun (and syquests are a little steep just for doing backups).

5681. Supra 2400Plus and xmodem questions:

Newsgroup: comp.sys.atari.st
Date: 1992-05-30 21:10:11 UTC
From: ehohnbau@Bonnie.ICS.UCI.EDU
Message-ID: <9205301410.aa27377@Bonnie.ics.uci.edu>
Source record: 221473

I have a supra 2400Plus which has CCITT v.42/bis capabilities but
I can't seem to get it to connect right with the v.42 lines
at school.
They have 9600 bad v.42 lines but I don't seem to get the right
connection.
The LAP (indicating use of a V.42 protocol) light on the modem comes on,
but the connect message is still "Connec 2400/REL" which is the message
for MNP connection, not v.42 connection.
Also, the straight MNP connection (from another line) seems to be
at least as fast.
So anyone know what the problem is? The network people at
school suggested that the Supra people didn't implement the V.42 quite
compatibly with some of the other modem brands and that may be the reason.

Next, xmodem:
I'm only getting around 200cps from my transfering, which sucks considering
I have an MNP connection. It this a limitation of the xmodem protocol or
do I need to find a way to tweak modem/terminal program settings to get
some more speed out of this darn thing?

Any and all comments would be appreciated.

5684. TAPE drives

Newsgroup: comp.sys.atari.st
Date: 1992-05-30 23:33:38 UTC
From: wmagro@roma.uiuc.edu
Message-ID: <Bp384H.JLL@ux1.cso.uiuc.edu>
Source record: 221477

Someone recently posted asking what it would take to make their tape drive work on the ST. They asked the recent 'reviewer' of tape software to respond. I guess that is me.

Again, Alan Hourihane's TAPEBIOS and GTAR packages are wonderful. To install the tape driver (TAPEBIOS) you just plop it in your AUTO folder, and edit a text file (TAPEBIOS.INF) to point to the SCSI address of your tape drive. My drive is a normal 1/4" cartridge drive, like those that come on workstations. I had no problems.

The GTAR package is the usual god-like 'tar' program that we know and love from Unix world (why do people write Un*x? it is too wonderful to mock). The tar is mint aware and backgrounds quite nicely. The tape driver doesn't seem to let go of the CPU very often, so that backing up to tape in the background isn't very effective--I usually type "tar cf '=tape' /dev/c /dev/d /dev/e" and then go to sleep.

All this should be available on atari.archive.umich.edu. If not, I can upload it.

FINALLY TAPE DRIVES WORK ON THE ST!

It's also the message for V.42/V.42bis unless you have enabled extended
verbose result codes. I use this init string:

at&f2\v2m3

> Also, the straight MNP connection (from another line) seems to be
> at least as fast.
> So anyone know what the problem is? The network people at
> school suggested that the Supra people didn't implement the V.42 quite
> compatibly with some of the other modem brands and that may be the reason.

I connect with a couple of Telebits regularly and the V.42bis compression
works just fine -- so long as you don't expect it to perform miracles.
It will not accomplish much if you feed it compressed files, and it
doesn't work very well with data that isn't in a continuous
stream. Also, the computer at the other end may simply not be very fast
when it's heavily loaded. If you're running a protocol that bothers the
CPU constantly, it may slow down.

> Next, xmodem:
> I'm only getting around 200cps from my transfering, which sucks considering
> I have an MNP connection. It this a limitation of the xmodem protocol or
> do I need to find a way to tweak modem/terminal program settings to get
> some more speed out of this darn thing?

Xmodem isn't a good protocol to use with either MNP or V.42/V.42bis. The
packet size is small, and Xmodem waits until it receives an ACK from the
receiver before sending another packet. Since the ACK is a single byte, it
gets delayed a bit by the modem-to-modem protocol, which really wants to
fill an MNP or LAP-M packet before sending it. This interaction can
actually result in a slower file transfer with the protocol turned
on than you would get with a generic 2400 bps connection.

Zmodem or a multiple-packet windowing protocol with decent-size packets
would be a better choice to run on top of MNP or LAP-M.

I've had some problems with my Supra 2400plus when sending files with a modem protocol enabled and the aux port speed set to 9600. The modem has an internal buffer that will fill rather quickly, and the RTS/CTS flow control must be reliable. Until SERIALFX.PRG became available, I couldn't rely on uploading. If you don't have it in your auto folder, get it (and its associated CPX).

Maybe it is because your magazine editors and publishers were SHOWN the computers.

I'm sure our magazine editors and publishers are reading your mags to find out what to tell us.

Besides, the U.S. Atari users are "Atarians" or they are very loyal to the company even though they have been treated very poorly. If Atari U.S. told these mags info and we didn't get it by the end of the year, it may be the end of all Atari U.S. users.

Date: 1992-05-31 04:33:05 UTC
From: bferrer@Bonnie.ICS.UCI.EDU
Message-ID: <9205302132.aa13634@Bonnie.ics.uci.edu>
Source record: 221480

I recently downloaded bison1-14.zoo from atari.archives and found
to my surprise they were only sources. Can somebody please upload
binaries of BISON to atari.archive (or email me a uucoded file)?
I also have an old version of bison which only works on grammer
files with carriage returns removed, but this gets very annoying
especially on big files.

thanks in advance,
bill

5689. Emacs 18.57 Problem

Newsgroup: comp.sys.atari.st
Date: 1992-05-31 09:37:48 UTC
From: ASI503@DJUKFA11.BITNET
Message-ID: <92152.113748ASI503@DJUKFA11.BITNET>
Source record: 221486

I tried to install emacs v18.57 from a.a. gnustuff/tos directory. Creating
a dumped version of emacs works fine on my system (Mega STE 4, Gulam Shell),
but the dumped emacs obviously has problems with the termcap file. Regardless
of the setting of the evironment variable TERM it issues the message:
'terminal not powerful enough to run emacs'
'... terminal does not support positioning of cursor'
I did not edit or otherwise change the termcap file. Could anybody post the
correct setting of TERM? Did I make any obvious fault during installation?
Thanks in advance.

Here a short explanation off the xhost entry:

sample entry:
sitetopoll|\
ATZE0b0e1v1x1q0|0:20/8/21-24%0-3%ag6-19|2400/r|\
t0365344451|\
ogin:|<loginname>|word:|********|\
\usr\spool\uucp\sitetopoll|707308628|707310258
last attempt: Sun May 31 11:37:08 1992
last success: Sun May 31 12:04:18 1992

explanation:

<sitename to poll>|
<modem initialisation string>|
hh:mm/hh:mm/[W][days]hh:mm-hh:mm[%<next poll time>]
----
up to 8 poll periods allowed
----
time period in wich polling is allowed
-----
days of the week for wich poll time is valid
a = sunday, b = monday etc..
--
(optional) only poll if things to send otherwise ignore this period
so you need atleast one poll period without the 'W'
----
minimum time to wait after succesfull poll
-----
minimum time to wait after unsuccesfull poll

<baudrate>|
I found out that putting a '/r' here forces the modem to send a <cr> before
the login sequence is done

<loginsequense>|
Hope the example is clear enough

<directory where receiving/sending files go>|

0|0
Time of last success /failure put 0 here uuwork will fill it in later

readable form of last two targets

NOTE: uuwork rewrites the xhost files every time it is called so keep a
backup somewhere and don't put any comment in it since it is overwritten
anyway.

Hope this helps

Harold

5693. Re: problems with IBM disks written on Atari

Newsgroup: comp.sys.atari.st
Date: 1992-06-01 06:02:31 UTC
From: Bob_BobR_Retelle@cup.portal.com
Message-ID: <59918@cup.portal.com>
Source record: 221482

Once again, I would give the disks a very close scrutiny with
an ST virus checker...

An ST virus can overwrite the boot sector info that MS-DOS
needs to see to recognize the disk, even if the disk was
originally formatted on the PC.

The symptom would be that the PC couldn't read the disk, while
the ST could...

From: Bob_BobR_Retelle@cup.portal.com
Message-ID: <59920@cup.portal.com>
Source record: 221483

About using IBM keyboards on an ST..

It all depends on what you consider "reasonable" for what you're willing to pay.

I tested a D.E.K.A. adapter unit recently.. I believe the retail cost of the adapter is $99...

Add to that the cost of an IBM style keyboard that will *work* and you're closer to $200...

Yes it worked... but... with five different IBM style keyboards I have here, I only got it to work satisfactorially with one.

The inexpensive PC keyboards worked.. but... had NO cursor keys.

The PS/2 keyboard, genuine IBM, went untested since the DEKA unit didn't have a PS/2 connector to plug it into.

An "autoswitch" XT/AT keyboard DID work.. BUT.. .only if it was unplugged when you booted up the ST. If you remembered to do that every time, it worked fine.

From talking to Omnimon, the makers of the DEKA, there are some PC keyboards they recommend, but they cost around $90.

Then again, I'm probably not the best one to ask.. I actually *LIKE* my ST's keyboard..!
:)

Does someone know if David Michael Betz (the author of
Xscheme, available at A.A.) has en e-mail address ?

I'd like to know if there are trace functionalities in
xscheme, too.
Please answer by e-mail. I'll summarize if somebody
asks.

Suppose the subject line says it all. I obviously know
how to use the lharc and minilzh programs, but PFX_PAK and the
other one, is it AFX_PAK, how do you fully use them. I have used
PFX_PAK to pack a few executables, most worked fine but a couple
bombed out. I was guessing as to what was going on but would
prefer a doc to make the most of it. As for AFX_PAK, what is it
haven't tried it mind you but still curious.

Thanks,

C.W.

5700. Does Multidesk Deluxe work with MiNT (v0.94)?

Newsgroup: comp.sys.atari.st
Date: 1992-06-01 10:09:56 UTC
From: AHOFFMAN@cipvax.biolan.Uni-Koeln.DE
Message-ID: <1992Jun01.100956.136663@rrz.uni-koeln.de>
Source record: 221491

Hi Networkers!

I just got MiNT v0.94 via ftp and decided to establish it on my system (1040 STFM, 4MB, 64MB, GEMINI v1.21german). Sad to say, the CHAMELEON (an ACC to load and unload other Accessories) doesn't work correctly. Since I usually more than six ACCs I'm now looking for an alternative to CHAMELEON. Especially I think about buying MULTIDESK DELUXE from CODEHEAD SOFTWARE. Does anyone have any experience with the combination MiNT plus MULTIDESK? -- I don't want to spend money for a program that is useless for me.

By the way: my good old ramdisk (the LUFTSCHLOSS from the german SCHEIBENKLEISTER book) also fails (it says: "ERROR IN MEMORY ALLOCATION" under MiNT). Is this a problem with the LUFTSCHLOSS, with any ramdisk, or are there any special tricks to avoid such problems?

If someone has any idea how to solve my problems, please post them to comp.sys.atari.st or send email to ahoffman@biolan.uni-koeln.de

Thanks in advance and keep hacking
Andreas Hoffmann

Hatari!

Well, when I do change resolution on my TT, most times my computer does
only draw 2 or 4 Bombs.

I know, since I use Mortimer, there are more often bombs, but what I
want to do is to change resolution by my own program, without making
a warmstart.

Does anyone know how to do that on a TT? And I would also like to know
how to do it on my ST, just to make only one program.

ThanX, Roland.

But does this encompass the motherboard cache, or just the tiny 8k on-board
cache? No program which really needs that sort of speed advantage is going
to fit into 8k (or even work in 8k, and thus cachable, chunks).

An 8k cahce on my 386 would not go far... (I have 128k cache on motherboard).

>is it just for other TOS versions?

Yes, unfortunately every TOS-version is buggy concerning RTS/CTS flow control. Even the latest (2.06 and 3.06) still have bugs which are however not as serious as in the previous versions. I've been working with TOS 1.02, 1.04 and now 2.06, and I neeeded a patch every time. Well, but if you have no problems, that's of course O.K. :-)

Christian

Accessories which install their own system vectors are often the cause for
this (e.g. the EDISON utility).

>I know, since I use Mortimer, there are more often bombs, but what I
>want to do is to change resolution by my own program, without making

I think you're referring to the STE-only games promised by Atari as
conversions of the exclusive arcade licences they claim to have bought
(ST Format, June edition). Given the quality of Arc s/w so far, I'm not
entirely exited by this news :-)

Sam.

For
the same reasons I am against the use of CTRL-ALT-DEL for resetting any
machine with an OS that is designed to stay running. I have allocated less
dangerous combinations as follows: CTRL-ALT-LSHIFT-RSHIFT-UNDO for cold boot
and CTRL-ALT-LSHIFT-RSHIFT-HELP for warm boot. Is there any other
application that uses these or similar enough to hit these by mistake?
Adam David. (adamd@rhi.hi.is)
Yes, there is. I allways use Tempus-Editor to do my type of typing.
I even do diff's with it, since it has a 'compare-text-buffer' function
buildt-in. And it can read 'any' document, even binarys, to show me strings.
Anyway, it can't save them back.
But to come to the point. I often load (Alt-x) and delete (Shift-Alt-Del)
them again quickly in a row. I have lost some hours of editing by hitting
Ctrl-Alt-Del instead of Shift-Alt-Del. I would have lost even more, if
Tempus hasn't had an auto-saving function.

>An 8k cahce on my 386 would not go far... (I have 128k cache on motherboard).

Only the on-chip cache. But remember that the whole program doesn't have to fit in the cache at once; that would give you a 100% hit ratio, which is nice but not necessary for the clock-doubling to make a difference. Since the execution of most programs involves staying within local sections for long periods of time (looping at various points, as opposed to constantly jumping wildly about) you often find decent cache hit ratios even with small caches. I expect that 8K chunks of execution are fairly uncommon; that seems quite large, really. To put it in less scientific terms, your entire spreadsheet doesn't have to fit in the cache; just the recalculation loops, drawing loops, etc. (Though it's not really that simple in the real world.)

Still, 8K seems fairly small. In general, though, the basic clock-multiplying principle will work very well in practice with a sufficiently large on-chip cache. Perhaps the 586 will have a larger on-chip cache for this purpose. My original claim was simply that the idea of clock-multiplying seems to make a lot of sense, since it keeps the requirements imposed on the motherboard constant (and therefore nails down everything but the actual chip itself at a nearly constant cost).

It's actually - "Castle Wolfenstein 3D"..... you run around a castle
hunting out Nazi's of various sorts etc. Sort of like Dungeon Master
in looks....
>version out for the ST? Thanks,

I don't remember the guys who make it (the games are at work, I don't have a 386 machine at home) but they seem to ONLY do games for PC's (You should see it on a 10Meg RAM 25MHz 386 machine :-)). The way it works is -> You get the first game as PD/Shareware and if you want the rest of the games in the series (I think there are 4 in this one.) you pay varying amounts.

I'd LOVE to get some of their games for the ST..... so if anyone knows more.....

Maybe you should switch to electric. Be a gold medallion netter, maybe? ;-)

Who bummed you out at Atari Oz? Was it Alastair Campion or someone else? I always thought Alastair was OK but I've heard some rumblings...

And Bob Brodie gave you some "bull?" Well, I _do_ hate to hear that as Bob has been one of the few folks from Atari Sunnyvale that you could usually count on to get the straight scoop... as limited as it often is. I don't know of a single occasion when Bob has knowingly lied. That's not to say that what he has said has always panned out, of course. Bob _is_ a company man, to be sure, but so far his reputation has kept him buoyed by most users/dealers/developers and still safely away from Atari's famous "revolving door."

Any specifics? I'd like to hear about 'em via email, please.

It's possible to format a 3.5" floppies on a sparc, write to them and
read them on an ST.
First use fdformat to low-level format the floppy, then use mformat to
write a dos-bootsector, FAT and root-directory.

It's short for Castle Wolfenstein 3-D (Profound Carnage), and it's shareware by Apogee Software. I don't think Apogee writes for any machines but the PC, except for a recent Nintendo adaptation of Commander Keen VI ("Aliens Ate My Babysitter").

Wolfenstein 3-D is a first-person perspective game a la Dungeon Master, but with smooth rotation (i.e., in increments of several degrees instead of 90 degrees). As such I doubt it would run well on a stock 8Mhz ST; the texture mapping needs a lot of speed.

|> atari ST. I have ZOO21 which I obtained from a.a.

I compiled the sources with GNU C and it works fine when
UNIXMODE ist set. If you don't have gcc, I can send you
a copy of the program.
But note: The program is as double as large as the old version
and runs a little slower. But I will compile it again with the new
and better optimizing version 2.1 of gcc.

I have no modem for my ST, but do my hacking from a VAX with a ST as
terminal (with UniTerm). So I really can't tell you how cheap it is. As
to GEnie itself: I heard about it, but am not sure as to what it really
is. Maybe the simplest way is to get in touch with SpiritWare w/o the
net and get something by snail mail.

But thanks anyway...

Use tcsh or another and the futils. You may also get the futils
separately and run them under Gulam. But then you must set to run
them.

Well, I received POPULOUS II on Friday afternoon and my family didn't see me again until _late_ Sunday night. I am not an avid gamer but I love this one.

What can I say except BUY it! It works with the new TOS (on my MegaSTe, anyway), it's not physically copy protected so it's easy to make a backup, comes with an install utility for the hard disk, and it hasn't crashed on me once! I have the 1Mb version which supposedly has better animation.

Too bad it doesn't have the Amiga version's music track but I'm not complaining. If you liked POPULOUS and mourned the fact that it would not work with the new TOS (2.05 and 2.06), then you'll be quite happy with POPULOUS II.

Thought you might like to know. Anyway, it's great to see a new product for the Atari from Electronic Arts and congratulations to the gang at Bullfrog!

I have an AT-SPEED at 8MHz. It works fine, except for harddisk acces. Once every few minutes (using turbo pascal 6.0) a read error occurs. I don't know where the errors are coming from. I suspect that the driver software tries to read through SCSI, without retrying itself. I never have problems like that using TOS. (I use ICDBOOT 5.3.0, and a Quantum drive.)

>
I think that most people are aware now that there really is no such thing as a standard PC-formatted disk. Different compatibles cannot always read one another's disks!

One possible answer to this specific problem is that of drive-head width. We had this at work when we had both 720k and 1.44M 3.5in drives on various machines. Some machines would read any disks but some were more finniky. We came to the conclusion that some heads were to one side of where they should have been, though still within spec, and those which were as far out in the other direction missed the data. 5.25 in drives were worse. Writing to a single-density disk with a high-density drive was guaranteed to produce problems.

I have TOS 1.04 and my sysop's compatible reads a disk formatted by TOS without any trouble. The Tandon's and Dell's at work often don't.

Keith

Actually, a Stacy should be worth more than an STfm. I've seen brand new Stacy 2 machines advertised for about $1350 mail order. This is rather disappointing considering that the Stacy 4 retailed for $2995 just 1 1/2 years ago. With the STBook due out, the Stacy machines have gone down in value a lot. I did recently sell my Stacy 4 for $1100 over the net though. It's a lousy price considering what I paid for it, but not bad, considering the new technology.

Jan,
Are you using an ms-dos disk cache? That is a definate no-no
for ATSpeed. I've got the 8mhz version and have no problems
with it at all...other than certain hardware-access problems,
like disk caches, which must be avoided...Oh, yeah, I cannot
seem to configure Kermit to work with my mainframe properly,
but that is most likely NOT a problem with ATSpeed (as others
have told me they can use terminal programs on it).

From: saj@chinet.chi.il.us
Message-ID: <1992Jun1.192056.4303@chinet.chi.il.us>
Source record: 221600

Whenever I try to restore an archive that has subdirectories on either of 2 STs (Mega 4 with TOS 1.2 and Stacy with TOS 1.4) I get a bus error. This is from either the desktop or Mark Williams msh. Either plain e as a command, or e /x or e -x or e /x+. Only programs resident on both machines are the 'classic' control panel and Atari HDX (v 3.? on the Stacy, 5.0 on the Mega). I presume I must be doing something so idiotic that nobody would bother to warn against it. This is with gen-you-wine T. Quester LHARC versions 2.1e and <whatever the latest one is on GEnie>. I also tried a version of arcgsh on the Mega (4.2? Whatever it was ran only in medium rez).

Anyway, will somebody please set me straight. I have 2 .lzh archives I can pull this trick with, and both claim to use LH5 compression and to pass integrity tests, so I suspect me and my setup rather than the archives.

Try looking in just about any Atari mags. Toad sells a MegaSTe for about $750, and there are others (I don't have a mag with me now to tell you) that sell for less, just look around. This may be without the drive, but then you should be able to pick up a 80MB drive in computer shopper or Micro Times, etc., for around$250.

Of course this price may be WITH the 50MB drive...

>Its in ALL TOSES, its a software hardware problem, this new fix SERIALFX
>is the first that I know of to Fix the hardware fault...

I'm pretty sure that TOS 1.2 (1.02) did have that fixed (that was why people were understandably upset when the bug resurfaced in TOS1.4(1.04) and TOS 1.6. I wonder though, wasn't that one of the bug fixes in 1.62?

BTW, whatever happened to TOS[2,3].07? Did they ever release it? Is it available with the TEC board? Or did they scrap it and just put all the fixes into MultiTOS so that (and I would agree) people wouldn't have to buy a cheap fix, only to turn around and buy another one....?

I just got ahold of 2 IBM keyboards and would like to hook them into my
atari, so I'm looking for Z-keys or other IBM keyboard interfaces, let
me know what your asking price is, or will trade for hardware (for instance,
one of the IBM keyboards).
Thanks,
Jonathan

I have a sodlerless, plug-in memory upgrade for sale (1/2meg -> 1meg). I changed to a SIMMS set up so I no longer need this. Actually I changed a while ago and just haven't gotten around to selling it...along comes spring cleaning and I need the drawer space...okay my spring cleaning is late too, sue me!!! Any *REASONABLE* offer will be entertained. I'm not looking for a profit here, if someone gives me a sob story and a decent price it's theirs, i just figure it's taking up space anyway :^)

E-mail me or phone me at home (6-11pm EST *PLEASE*)

I don't actually have Minix running on my TT.. but I do have a 13MB Minix partition on one of my hard drives (a left-over from when the drive was connected to my ST). 13MB is nowhere near enough to get the GNU stuff working. I could (can) recompile the GCC 2.1 C pre-processoor (which is the most important) and gcc-as and the linker.. I'll have a go at thhem, but I doubt that my port will be the same as the original (though I will try to make it so).

WM>
WM> FINALLY TAPE DRIVES WORK ON THE ST!

I agree! I just bought a 250Mb Tandberg drive. Backing up the 210Mb and 2 65Mb drives is now a breeze. Takes about 45 minutes for the 210Mb, and another 28 or so minutes for the other (2nd tape). MUCH easier than stupid floppies!

>But [Castle Wolfenstein 3D is] not as smooth as Ultima Underworld for the PC.

True, and Wolf 3D doesn't do lighting, true 3D rooms (e.g., ramps, jumping about, etc.), or water movement (not to mention levitation :>). And if you look carefully, you'll also notice that you always see the same side of an object regardless of what angle you look at it from. The tables with chairs around them are particularly obvious examples.

Whereas Ultima Underworld is a "dungeon flight simulator" computed in true 3D and with textures mapped onto "real" 3D surfaces, Castle Wolfenstein is really a 2D game with a 3D-ish front end. Wolf also isn't much on gameplay, while UU is fairly complex. Then again, Wolf is shareware, while UU took 20 programmers 2 years to produce and is US$60.

Still, for anyone interested in fantasy genre games, the latter is a must-see.

My experience is that the problem wouldn't show up in z-modem, which is
inherently self-correcting. A guaranteed way to reveal any flow control
problems is to log on some machine and cause a lot of text to be scrolled
by on your screen. Example - log onto a Unix box and do an "ls -l" on a
very large directory (several hundred files). This identified the problem
for me, and TurboCTS fixed it.

Uh, sorry to rain on your parade Steve, but what you asked is illegal. All TOS programs, whether on disk or in ROM, are copyrighted programs owned by Atari Corporation. You need special permission (aka a license) to distribute Atari TOS for any purpose. Even though TOS 1.0 and 1.4 are somewhat widely available on disk due to their initial introduction in that format, it's still not legit by Atari. Contact Bob Brodie at Atari for the straight scoop.

Sorry, but I know you don't want to break any laws (even the dumb ones). ;-)

5748. Logitech Mouse is nice

Newsgroup: comp.sys.atari.st
Date: 1992-06-01 21:47:52 UTC
From: davea@col.hp.com
Message-ID: <1992Jun1.214752.21413@col.hp.com>
Source record: 221582

I came across a Logitech Mouse that interfaces very nicely to the 520-ST.
Is much smoother than my (old) Atari mouse and quicker.

This seems to be of interest from time to time, so here's the info. It's a
Logitech P7-3F-AO that came with an Apollo/HP workstation (Apollo A1630-82009).
Don't know if that's generally available, but suspect it is. Has a 9-pin male
connector of the rs-232 sort. It has three buttons, so just ignore the
middle one. You can make an adaptor using two female connectors or replace
the mouse's male connector with a female. Connections are:

Atari	Logitech	Signal
1	4	left-right
2	5	left-right
3	3	up-down
4	2	up-down
5	-	(not used)
6	9	left-button
7	1	+5v
8	6	gnd
9	8	right-button
-	7	middle-button (not used)

>>and rumors.

I have used the super charger for about a year. It works fine with most
programs. It occasionally locks up when a program tries to use com1:. You
see, com1 is the mouse, and it just doesn't work well as a modem.

I also (occasionally) get a repeated character at the com port. No idea
why.

The good news: I have successfully coded, compiled and tested C programs
that were to be used for telecommunications in a MS-DOS environment. Hundreds
of users never knew it was compiled on an Atari 1040 STe. :-)

> it say that MiNTS does NOT run GEM program. Just TOS and TTP ONLY!!!

I think you misunderstood the docs. MiNT will quite happily run most
GEM programs (including the desktop). However, only *1* GEM program
can run at a time, because GEM uses variables in a fixed location in RAM
to keep track of things.

The problems with Megamax Modula-2 stem from some incompatibilities in
Megamax's library.

Very very big interest, indeed! It is worth the traffic, of course -
saves lots of reinvented wheels by other TT users out there (speaking
for myself, too :-)

Typical PC game producers. Assume everyone has a fast machine, and if somebody doesn't then they're not worth supporting.

>I'd LOVE to get some of their games for the ST..... so if anyone
>knows more.....
>The way it works is -> You get the first game as PD/Shareware and if

>this one.) you pay varying amounts.
Yeah, I'd love to see this kind of game for the ST... but it won't happen, because the kind of programmers who write games for the kind of PC you mentioned above have no idea of how to write a game to fit into a real computer. They seem to believe that everyone has 20 megs of disk space going spare and a fast machine on their desk. Well, I for one _don't_.

NeXTStep is not going to be available for 386s, but for 486 and above.

5754. What makes a disk version of tos different?

Newsgroup: comp.sys.atari.st
Date: 1992-06-01 22:44:32 UTC
From: selick@csa.bu.edu
Message-ID: <87500@bu.edu>
Source record: 221587

I am considering an upgrade from tos 1.6 to 2.06. I would very much like to take the version 1.6 that's in my machine and make it into a disk version so that when I put in the new roms, I can still go back to 1.6 if necessary with the quicktos program on terminator. What makes an image of tos different from a disk version of tos? Can I simply make an image of my tos and run it from hard drive later?
Steve <selick@csa.bu.edu>

5755. Does an english version of Megamax Modula-2 exist?

Newsgroup: comp.sys.atari.st
Date: 1992-06-01 23:23:19 UTC
From: n8742883@rowlf.cc.wwu.edu
Message-ID: <n8742883.707440999@rowlf>
Source record: 221591

I got information about Megamaxes' Modula-2 from a gentleman
on the net, but he said the documentation is only in english.

Does anyone know if an english version exists? If so, what's
the price on it?

Any additional comments / opinions / criticisms / etc. about
Megamaxes' Modula-2 is welcome. Right now I'm using TDI's M-2, and
that company went out of buisiness about 3 years ago and I'm looking
for a more current modula-2.

Thanx,

5756. OXYD 2 - perhaps it doesn't work because...

Message-ID: <8157@uqcspe.cs.uq.oz.au>
Source record: 221590

I have tried to run Oxyd, Oxyd2, and Spacola.

None of them worked.

But over the weekend, I wanted to show a friend the cool look-sound-and-feel
of Oxyd2. I (again) tried to install it - this time I tried using floppies
rather than HD.

Guess what?

It fits **EXACTLY** onto a standard floppy format.

I'm suspicious. Perhaps it is not working because some file in the
archive is truncated. Has anyone actually got it to work? I'll be
sending my DongleWare money as soon as I'm sure there isn't some
German-machine-specific code or something being used.

Warwick.

I checked out some mags already the $750 Mega STe are w/o HD, and only with
2 megs I do believe.(Even though memory are now fairly cheap.) But
adding all the cost together, your $1000.00 Mega STe is over $1000.00.
And adding a new monitor makes it even more.

In article <59920@cup.portal.com> Bob_BobR_Retelle@cup.portal.com writes:
>About using IBM keyboards on an ST..

[Various complaints about keyboard adapters and associated costs deleted.]

There is a small (~1K) driver on atari.archive (in a file called deckey I think) which allows the use of a DEC LK201 keyboard (and presumably compatibles) through the serial or midi ports of the ST. Using the midi port requires a small hardware mod. New LK201's are expensive, but you might be able to pick up a used one, or a cheap compatible.

I have used an DEC keyboard through my midi port for a couple of years now with only one small problem--the software driver doesn't handle MiNT's cntl-alt-key sequences. Anyone with a little knowledge of assembly could probably fix this.

Good game.. it stands for wolfenstine (sp???), a German prision.
You go around a maze (3d) of corrodors & rooms (brick walls beside you),
and shoot the guards & dogs etc before they get you.
Not the sort of game you'd want kids to get their hands on, blood splurts
out of the people/dogs when you shoot / stab them!

It's a shareware game for the PC, so if it is out on the ST i'd love a copy.
If not, maybe someone could contact the author & do a conversion for the ST?
(It runs in VGA on the IBM)

I haven't been keeping close attention on the thread about Atari disks not being readable on an IBM, but I not-too-long-ago picked up a file called "IBMSTUFF.ARC" from an ftp site (I think it was terminator...) and the docs claim to format a disk in IBM format or fix a disk that an IBM claims is unreadable. I haven't tried it yet, though...

Message-ID: <1992Jun2.005218.11464@newshub.ariel.yorku.ca>
Source record: 221598

I recently got a file from a German FTP site (site name escapes me right now) called amiga_emu.arc. I extracted it, executed it and it reported it was an Amiga emulator, and it was loading workbench 1.2. Next thing I know is after WB 1.2 is loaded, I get at the top "23 bytes free". First of all, I am assuming this is not some kind of demo program (but it looked a little different from the way I remember WB on the Amiga) and I guess it needs more memory. If anyone else tried it and got it working on a 520 (doubt it) or a 1040 (23 bytes free), speak up!

this FontGDOS? It seems to me to be a waste of time and money? Just more
hassles for users and developers to put up with when FSM ships and
people switch over.

>Typical PC game producers. Assume everyone has a fast machine, and if
>somebody doesn't then they're not worth supporting.
Actually, as far as I know it's NOT necessary to have the kind of
machine I mentioned to run WOLF-3D :-). It just makes it faster and
more enjoyable.

>>The way it works is -> You get the first game as PD/Shareware and if
>>you want the rest of the games in the series (I think there are 4 in
>>this one.) you pay varying amounts.
>Yeah, I'd love to see this kind of game for the ST... but it won't happen,
>because the kind of programmers who write games for the kind of PC you
>mentioned above have no idea of how to write a game to fit into a real
>computer. They seem to believe that everyone has 20 megs of disk space going spare and a
fast machine on their desk. Well, I for one _don't_.
Well..... at home I have an ST & I don't (usually) play games at work
(I'm too busy fixing other pples computer problems (of the
networking/Appletalk sort) and trying to figure out why a certain
antiquated device is losing its mind.))

I hope I didn't seem to imply that I (personly) have the use of the PC
I mentioned above for my own use. It's one of the tools used by my
little part of the world here. Personnaly, (I'll never get that spelled
correctly!) I use a Mac that is (VERY) underpowered for the tasks it
does.
& I MUCH prefer trying to figure out my DecMate II w/64k to any 386
beastie.

I think I've run overlong in this........

For a start, the Disk-TOS versions are all copyrighted, and so you
could get into trouble for doing that.

And secondly, they are pretty huge to send through E-Mail as UUencoded files

Try going to a local Atari Dealer and asking them if they could lay
their hands on a copy / copies for you.

(Following up on myself at last ...)

After some debugging yesterday evening, I'm proud to announce that at least
this bug is fixed. It was caused by a missing NULL pointer check in fileio.c.

Here are two patches - one will fix the bug, the other will let you compile
fileio.c with patchlevel 20 of the MiNT library (some error numbers seem to
have changed). Note that I didn't try to recompile everything with PL 20 ...

```
---8<-----------------------------------------------------------------8<---
diff -c orig/fileio.c src/fileio.c
*** orig/fileio.c Mon Jun 1 21:34:18 1992
--- src/fileio.c Mon Jun 1 21:46:34 1992
***************
*** 2104,2110 ****
--- 2104,2117 ----
{
/* If the file doesn't exist now and didn't exist before,
we say that it isn't modified, provided the error is a tame one. */
+ /**
+ ** (jjk++) ### FIX THIS: MiNT lib PL 20 doesn't have ENOTDIR
+ **/
+ #ifdef atarist
+ if (errno == ENOENT || errno == EACCES)
+ #else
if (errno == ENOENT || errno == EACCES || errno == ENOTDIR)
+ #endif
st.st_mtime = -1;
else
st.st_mtime = 0;
***************
*** 2360,2367 ****
** (sjk)++
**/
#ifdef atarist
! _dos2unx(homedir,unxdir);
! homedir = unxdir;
#endif

if (homedir != 0
--- 2367,2379 ----
** (sjk)++
**/
#ifdef atarist
! if (!homedir)
```

```
! homedir = "\001"; /* no file name should start with this */
! else
! {
! _dos2unx(homedir,unxdir);
! homedir = unxdir;
! }
#endif

if (homedir != 0
---8<----------------------------------------------------------------------8<---
```

Hope this helps,

Jens.

/ hpbbrd:comp.sys.atari.st / ASI503@DJUKFA11.BITNET (Erik Sodtke) / 3:37 am May 31, 1992 /

Two solutions:

- Put your terminal description into the TERMCAP variable (instead
of the termcap file name). This would make your TERMCAP look like

TERMCAP="st52|Atari ST running MiNT:li#25:co#80:...:"

- Remove all the CR characters from the termcap file. Emacs doesn't
like them.

Good luck,

Jens.

Okay it's unlikely to work on a TT, but there _IS_ a (X?) BIOS call to
set screen rez + phys & logical address etc and I have written a perfect
(.TOS) utility that saves colours, changes rez printes on the screen,
get a keypress, changes back to the right rez and then makes sure the colours
are as before - all using TOS calls - so no flames about poking I/O etc

This works on my STFM and as it uses only TOS calls it should (better had)
work on a TT.

mail me for the source if you are doubtfull.

Because FontGDOS requires less memory. It`s for the users with the old ST`s
and ~ 1 MB RAM.

Not true at all, unless my version of Mint has developed a strange mutation.
I can happily run Gem programs under Mint (though the shell doesn't always
do everything it should). I've never tried to suspend a window based program,
but I've quite happily suspended programs that use other aspects of the AES,
and the VDI

5776. IMG-File save routine wanted

Newsgroup: comp.sys.atari.st
Date: 1992-06-02 09:42:00 UTC
From: hansen@ikki.informatik.rwth-aachen.de
Message-ID: <hansen.707478120@ikki>
Source record: 221519

Hello there!

I recently got in charge of improving the software package "ImageLab" which is being used for picture processing.

One thing I'd like to change is the the routine that is responsible for saving IMG-pictures. In it's current state, there is no compression, so the pictures are quite large.

Does anyone have a clever subroutine or algorithm which does proper saving of compressed IMG-pictures? Oh, by the way, the programming language is Pure C (Turbo C), of course.

Thanks in advance

Oliver

hansen@messua.informatik.rwth-aachen.de

PI> vga card for 75, 80 meg drive w/ controller for 300. Windows for < 100$.
PI> Tack this on a 286-16 and you will have almost 2ce the speed of an 8MHz ST
PI> and a wider range of software.
PI> Benchmarks will prove the speed increases.

You're leaving out a lot here - to get the DMA sound of an STe, you'll need SoundBlaster or SoundBlaster/Pro - $199/$299 respectively (not used prices - gee, I can get a used 520ST for <$100 now). I can get an 80 meg with controller for the ST as well for $300. I'll give you Windows for < $100 (providing you get in on the "jump the OS/2 ship" deal), but then your speed increases just went right out the door... not to mention your HD and memory space.

No, the older STs are not "state of the art", but 7 years after their introduction, they're still comparable. In 1985, when the ST was introduced, most 7 year old designs were sitting in a closet collecting dust (my old TRS-80 model I comes to mind). MS/Dos clones are just catching on to "point and click" and contiguous memory addressing, and those machines are still over the $2000 mark.

>>But [Castle Wolfenstein 3D is] not as smooth as Ultima Underworld for the PC.

A couple of friends of mine are playing UW and Wolf 3d on the PC's
right behind my back, so I couldn't help commenting. Running on 486's,
Wolf is definitely faster than UW, graphics are slicker, perspective
is not distorted as it is in UW, and a bunch of other things as well.

>True, and Wolf 3D doesn't do lighting, true 3D rooms (e.g., ramps,
>jumping about, etc.), or water movement (not to mention levitation :>).
>And if you look carefully, you'll also notice that you always see the same
>side of an object regardless of what angle you look at it from. The
>tables with chairs around them are particularly obvious examples.

Wolf 3D is less advanced, but what can you expect for nothing? ;-)
The non-rotating object don't matter really much, since all nearly
all objects are round (tables are round, barrels are round, lamps
etc.). Besides, using bitmapped objects generally looks better, and
using 3D vector objects is bound to slow down the system too much
(see UW, there aren't all too many 3D objects, are there?)

>Whereas Ultima Underworld is a "dungeon flight simulator" computed in
>true 3D and with textures mapped onto "real" 3D surfaces, Castle
>Wolfenstein is really a 2D game with a 3D-ish front end. Wolf also
>isn't much on gameplay, while UU is fairly complex. Then again, Wolf
>is shareware, while UU took 20 programmers 2 years to produce and is US$60.

I'll grant you that; Wolf is a shoot'em-up (much like Eagles Nest in 3d),
while UW is a crossing of Dungeon Master in Real 3d and Castle Master...
Still, I don't find UW quite as addictive as DM (nor as difficult), and
I'll give Wolf 3D max. two days of interest.

>Still, for anyone interested in fantasy genre games, the latter is a must-see.

Definitely. Run it on a 486 and watch the PC come to life... It's
quite impressive, and rather impossible on a vanilla ST. (A TT or
the yet-to-come Falcon, though...)

Still, let's keep PC games discussions off c.s.atari.st, shall we?
After all, there are dedicated lists for this.

>correct setting of TERM? Did I make any obvious fault during installation?
>Thanks in advance.

This sounds very much like a problem I had once. Try to look at the termcap file. Look for a capability (the little two-chars things) that change (or rather imports) the termcap entry for another terminal. This makes for nice modular termcap files, but emacs apparently can't handle them. The fix to try is to take all relevant definitions and combine into one entry. Should be fairly obvious, once you got the file.

Another problem I once ran into, was continued lines. Here I had to put all definitions into one long line. Don't really remember though if that had anything to do with emacs (and what version if it was).

May be that your keyboard is different. Try the key next to the 'z'
perhaps on your keyboard it's not the '\' or '|' key.

I found out about the NAV2 setup by trial and error.

I'm still having problems with the pilot's log getting trashed. Anyone
else experiencing similar problems?

Lez

P.S. I've now purchased (not particularly for using with A320) the real
official Royal Air Force En Route High/Low Altitude Maps - 523 and
510E/W respectively - for the UK. And not only is the UK covered on
only one sheet but they are also much better than the supplied
Jepperson (sp?) maps. (You (ie. anyone) can also get these for the
other parts of Europe the A320 covers)

I can supply the address of the RAF if anyone's interested.

>Steve <selick@csa.bu.edu>

It's not quite that easy, Steve. I'm not a hardware person so I can't give you any better technical description other than it doesn't always work. :) Maybe other hardware gurus on the net can explain. I'm not familiar with quicktos but most of the other PD disk-based-TOS loaders didn't work with anything other than TOS 1.0 or 1.4. Don't know why.

Why don't you just take the easy way out and buy one of Codehead's TEC boards with the optional adapter that let's you use both your old TOS and the supplied TOS 2.06? The adapter does not work with all machines, however.

Hmmmm. I asked Atari Sunnyvale about FSMGDOS yesterday and was told the delay was due to tech problems (but there may be more than a hint of truth to what you say about legal problems, though). Supposedly, Font GDOS is a subset of FSMGDOS so that if the latter ever comes out, drivers written for Font GDOS should work without modification. That's OK. If Font GDOS is as good as the specs lead one to think, I'll be quite happy with it for the time being!

I have attempted to mail a response to you several times, but it always bounced back.

SpiritWare has both English and German versions of the Bible available for use with our concordance programs. The German versions (Luther '84 and Revised Elberfelder) can be obtained in Germany, but I don't have the names and addresses with me right now.

The English versions can be obtained directly from SpiritWare at:

SpiritWare
Fifteenth Avenue Bible Church
15211 15th Avenue N.E.
Seattle, WA 98155

Version 2.2 of the concordance is $10.00
The KJV Bible is $20.00
The NIV Bible is $30.00

Version 3.0 will be out in July along with the Greek New Testament.

>a 1040 (23 bytes free), speak up!

If I'm not mistaken, Tony, the "Amiga Emulator" is a joke. It doesn't do
anything other than what you just said. The same thing is "available" for PC's
as well and every bit as functional as the one you have. :) If there really
is such a thing, I'd like to hear about it, but I have grave doubts. The
Amiga has so many custom chips for graphics and sound that it would be tough.

Interestingly enough, I've been told by one of our customers that there _is_ a
functional Atari ST emulator available for the Amiga. In fact, he bought our
software to use on the Amiga with ST emulator! I don't know if this is a true
commercial product or how they got the TOS code (stolen, perhaps?).

> Scott Corley

2 good reasons seem to be: FSMGDOS requires a meg, whereas FGDOS
works on any system, and allows you to use far more fonts than GDOS 1.1
by font caching (sp?), and secondly, it's far cheaper than FSM, which
not everybody may require. Maybe that's three reasons... anyway, I don't
think it's a bad idea really, though distributing FSM at the same price
would have been an even better move !

Sam.

There was a big fuss about this when the STe was released. Ranarama was one of
the bundled games, and it won't even run on an STe.

Try Eye of the Beholder VGA with SoundBlaster on the PC, or even DARKMOON,
seen the version on AMIGA, nothing that compares to the PC version though.
I have DM and DM II, liked it alot, but then when EOB came out, I had to
buy it after experiencing DM and DM II on my ST.
UW is a good game and it is like CASTLE MASTER in away, but about several
factors better in graphics. I of course took it off since it took quite
a chunk of HARDDRIVE space. EOB though takes about 2 megs so its worth
having on the HD.

Actually, FontGDOS comes with FSMGDOS. It's an improvement on the original
GDOS (as described in an earlier post) and is included for backward
compatibility with older software. I didn't bother installing it, myself
(I HATE the supplied bitmap fonts -- ew, yuck, ugly ugly ugly :-) ).

Hmm, I would like to know where you get this idea, Roger. Especially since people already have it along with Wordflair II. Atari U.S. has made no announcement of this sort and it seems to me this is just another rumor. It's sad that some legal hassle has to get in the way of such a good program (I'm not saying there haven't been any legal hassles at all), but for Atari to drop it entirely because of this would be a little odd, don't you think?

5798. Re: More problems with Emacs

Newsgroup: comp.sys.atari.st
Date: 1992-06-02 19:45:20 UTC
From: sundsted@cis.uab.edu
Message-ID: <1992Jun2.194520.28265@cis.uab.edu>
Source record: 221527

After a significant period of hair pulling I have managed to get
Emacs 1857 up and running on my ST. And there are definitely a few tricks
to the whole process... Since the whole (arggggg...) experience is
fresh in my mind (and Emacs is such a wonderful editor which everyone should
be able to use) I thought I'd describe what I learned...
0) start off in gulam, or bash, or some other friendly shell (the
whole process doesn`t seem to work from Neodesk - at least not with me) and
make sure your hard drive has got a bunch of free space
1) unzoo the zoo file with UNIXMODE turned on (/.,rELAHdb)
This gets you the long filenames which all of the emacs lisp files seem to want
(and prevents you from having to edit the loadup.el file)
2) setenv all of the environment variables, I had the best luck
with things like:
setenv EMACSDOC /dev/e/etc
setenv EMACS...
note the directions of the slashes and the strange method of specifying
drive e! Emacs seems to want things this way.
3) do dumpemac (and wait)
4) set your terminal stuff
I used:
setenv TERM atari
setenv TERMCAP /dev/e/etc (or where ever it is)
Unlike most ST programs, Emacs handles screen output through the use of an
entry in the termcap file. This step is important (and make sure you set
the path correctly... I lost wads of hair figuring this one out)
5) now try running the thing. I suggest just typing _emacs_ because
there is nothing in the emacs.rc file you really need (as a matter of fact, go
ahead a delete it for the time being)
6) if you are not running MiNT everything should be just fine...
load, save edit... but be careful, Emacs likes UNIXMODE being set. I have
found that it will happily create .dir files and long file names
whether or not UNIXMODE is set. This isn`t necessarily a problems
(I don`t know what it is - a feature I guess).
If you want to use MiNT, I suggest 0.94 (it works for me) with all
of the same settings. The shell is the tricky part. I have tried tcsh,
mintshel and bash under MiNT. The only one I got emacs to work correctly
with was tcsh (which is very strange because several other people have
had similar problems but wound up with a different shell which worked --
one guy could only get it to work with mintlshel, another with bash). I
guess you just have to try them all. I've never found any common
denominator. It main problem seems to be the inability to load or save
files (^X^F or ^X^S). A file will load correctly from the command line?!?
7) other things -- setenv SHELL .... and ^Z will created a new shell
and allow you to do a few things and then get back into emacs.

Try these things and see what happens. If anyone figures out the
MiNT ^X^F problem I`d sure like to know what it is (as would several other
people).

Well just Type the file name, this is a feature of LZH201*, or use this
x -xhm filename or some times x -xkhm filename the k it to skip incompatible
headers, the latest version is LZH201L...

5800. pushing a label value onto the stack in assembly

Newsgroup: comp.sys.atari.st
Date: 1992-06-02 20:24:22 UTC
From: scoile@gmuvax2.gmu.edu
Message-ID: <1992Jun2.202422.21935@gmuvax2.gmu.edu>
Source record: 221425

I just got Prospero's "Developer's Toolkit", and have been playing around with the assembler. I have been unable to get something along the lines of the following to work:

```
...
move.l #string,-(a7)
...
string dc.b "This is a test",0
```

What I'm trying to do is push the address of the string onto the stack. The assembler won't let me do this, claiming that "#string" evaluates incorrectly, or some such message. How do I do this? My understanding is that I don't want to use

```
move.l string,-(a7)
```

as that would push what is at the location 'string' (namely, the value "This") onto the stack.

Thanks in advance for in advice.

-Steve

5801. Re: FontGDOS released by Atari USA

Newsgroup: comp.sys.atari.st
Date: 1992-06-02 21:04:54 UTC
From: aa384@cleveland.Freenet.Edu
Message-ID: <1992Jun2.210454.28536@usenet.ins.cwru.edu>
Source record: 221536

In a previous article, gfarrell@fraser.sfu.ca (Gordon James Farrell) says:

>In article <8161@uqcspe.cs.uq.oz.au> warwick@cs.uq.oz.au writes:
>Actually, FontGDOS comes with FSMGDOS. It's an improvement on the original
>GDOS (as described in an earlier post) and is included for backward
>compatibility with older software. I didn't bother installing it, myself
>(I HATE the supplied bitmap fonts -- ew, yuck, ugly ugly ugly :-)).

Well, I for one was not very impressed with FontGDOS. The 400K+
distribution on GEnie was missing the INSTALL.PRG and I couldn't get
the thing to run without bombing (maybe because I had no EXTEND.SYS
without the install). Many have been complaining that FontGDOS doesn't
work with anything. Someone went as far as to ask if FontGDOS worked
with anything at all.

Atari will not permit the full FontGDOS to be reposted outside
of GEnie, so most of the online community can't get it (not that it
is worth paying to download something that doesn't work)

With the CPXs and all, it looks like it could be a good program,
if the problems could be worked out.

Later,

One problem that any atari-ite will have using the internet to post messages is how exactly to use the ftp process to download software. If you are likeme, where Iuse an IBM or MAC system at a mojor university and do not use your atari for your interneting, then what do you do. The diskett is formatted for IBM or MAC usage, right. So, how do you get that, say, Umich.archive stuff to your atari if you are in my situation. I have checked out The Well out of SF and even they don't do FTP stuff yet. Am I studk using another internet acceess system, paying for both toll calls and the monthly service feel and telephone usage time, or is there another approach. Remember, at home all I have is a 1200 baud modem, some wp software, and a modem program. Any help yould be helpful and appreciated. . D. Atari-Man, PO Box 5026, Boone, NC 28608.

5803. MIST Atari Fest IV

Source record: 221246

```
**********************************************************************
MIST Atari Fest IV MIST Atari Fest IV MIST Atari Fest IV
**********************************************************************

All systems are go for MIST Atari Fest IV in Indianapolis on July
25th, 1992!

Vendor response has been fantastic and far exceeds last year's
interest as of June 1st. The following list represents ALL
CONFIRMED vendors who will be attending MIST Atari Fest IV.

Bob Brodie (Atari Corp.)
Branch Always Software (GEMulator)
Clear Thinking (EdHak)
Codehead Technologies (Calligrapher, Warp 9, TEC)
D.A. Brumleve (Kid Progs)
Electronic Spinster Graphics (clip art)
ICD (power peripherals)
INAGM (Atari sales and service)
Mars Merchandising (Atari ET, Lynx, 8-bit software)
Maxwell CPU (Silhouette and a BRAND NEW product)
Megatype (fonts)
Missionware Software (Flash II)
MP Graphics Systems (consulting)
MS Designs (fonts and clip art)
Rising Star (software)
User Groups:
ASCII
BLAST
Cin'tari
LCACE
STAR

Others who have expressed an interest in MIST Atari Fest IV but
have not confirmed are:

Gribnif
Joppa Computer
Lexicor Software
Paul's Computer Service
Step Ahead Software
Synergy Resources

MIST Atari Fest IV promises to be another success, with some new,
special twists to make your visit to Indianapolis more fun,
enjoyable, and profitable.
```

Exhibitors (upon request) be will driven to and from Indianapolis International Airport and their hotel rooms. Vendors will receive a 3.5" disk containing a listing of all attendees and prize winners. All vendors are invited to a post-event dinner the evening of the show. MIST will also provide someone to watch your booth so you can take a break from counting all that money and go to the bathroom, get something to eat, or just wander around the floor.

The first 250 individuals through the doors will receive a free 3.5" Maxell SSDD diskette containing text, data, and picture files promoting the Atari community in central Indiana. A special priced "MIST User Group Membership" will be offered to all individuals. Several new and different seminars, geared toward "Joe User" are being planned. Lynx and MIDI Tournaments will be offered with prizes to the top players. Several styles of "unique" limited edition T-shirts will be for sale (there's one we really think you'll like). And as usual, a spectacular assortment of raffle prizes will be given away throughout the day. MIST has also contracted with the Quality Inn Castleton Suites to provide single and double rooms at a reduced rate ($55 a night) for the those attending the show. They can be reached at (317) 841-9700. Make sure to mention MIST Atari Fest IV to get the special rate.

We will be uploading directions to MIST Atari Fest IV in the next few days, or you can request that directions be sent to you by leaving a message to Dan Ward on GEnie (D.WARD10) or by calling (317) 254-0031. If you have any other questions or concerns feel free to contact Dan about those as well.

MIST looks forward to seeing you!!!

MIST Atari Fest IV
Saturday, July 25, 1992
10:00 am to 5:00 pm

****
ATTENTION ATTENTION ATTENTION ATTENTION ATTENTION
****

Due to the unexpected reduction in domestic air fares Mid-Indiana ST has extended the deadline to register as a vendor for MIST Atari Fest IV in Indianapolis, Indiana on July 25, 1992.

The new deadline is July 3, 1992.

If you were interested in attending MIST Atari Fest IV, but the cost of air fare to Indianapolis was keeping you from committing, then now is you chance to participate in "one of the best one day shows in the nation".

MIST will help you keep costs low by only charging $50.00 for a single booth, providing special hotel accommodations at just $55.00 per night, and by providing transportation to and from the airport.

Contact Dan Ward at (317) 254-0031 or on GEnie at D.WARD10 to receive a registration packet and to reserve a booth at MIST Atari Fest IV.

5805. HORIZON

Newsgroup: comp.sys.atari.st

Well seems that HORIZON computers is back again, too bad. Like I indicated before, they are a rip off!!! Of course they take the advantage and monopolize on being the only ATARI dealer locally.

By the way does anyone think POPULOUS II for $54.00 is steep? That's the price they quoted me. If there is a cheaper place through mail-order, let me know, thanks.

Jeff

I have the following complete system forsale. THE SYSTEM IS CURRENTLY
compatible with ST software, PC software, and is ready for MAC emulation,
and ATARI transformer. READS AND WRITES 720K PC/AT disks, and ST formats
also.

*ATARI 520STfm with 1 meg RAM, 720K internal Drive
With internal clock and calender, keyboard
anti-static pad, 9 pin extender for easy access, and
TopCase Cooling FAN (LOW NOISE) for the POWER SUPPLY
SPECS:
MC68000-8Mhz 32 BIT/16 BIT arch.
MIDI IN/OUT
VIDEO card built in for low, medium, and high rez.
Emulates MAC with GCR 30% faster than the MAC
(GCR not included)

*BEST MOUSE (2-button oval shape) w/pad

*External 360K drive

*RGB color monitor ATARI 1124 w/ swival monitor stand

*External HardDrive Case with Power Supply (Ready for HD)

*about 400 3 1/2" 720K floppies with case holders.
Many titles that still have original boxes.

Such Titles as:

PC-Ditto software.
SPACE ACE
WAR IN THE MIDDLE EARTH
FIRST WORD
SHADOWGATE
BAAL
WAR CONSTRUCTION SET
OGRE
OBLITERATOR
and more...

*BOOKS such as GEM programmers reference from ABACUS
MANUALS, MAGAZINES, AND ORIGINAL BOXES are included.

BUYER GETS EVERYTHING ... $650.00

Message-ID: <1992Jun2.235444.18965@newshub.ariel.yorku.ca>
Source record: 221544

I have heard from one person that it was a joke file (although the person does take a liking to insult inquisitive people...) while 2 others are interested in the file. I don't know if it is a joke file or not...

Especially if there is an Atari ST emulator out there for the Amiga. I can almost assure you that one exists as a friend of mine was asking for a copy of TOS if I had it on floppy to load in the ST emulator on his Amiga. At the time he had a copy of TOS 2.06 on floppy, but it didn't work (bad copy of the TOS). Well, with such an emulator for the Amiga, why can't there really be one Amiga emulator for the ST?

From: morrison@ee.ualberta.ca
Message-ID: <morrison.707537391@ee.ualberta.ca>
Source record: 221549

Okay, I downloaded nearly infinite files for GCC 2.1, unzooed, put in the proper directories, set up the appropriate environment variables (as supplied to me by helpful people who answered my last post), and wrote the first simple 'hello.c' that is in all the textbooks, and I am told that 'crt0.o' is not available. I look. Lo, it is not available. It was not in any of the archives I got.

One person told me that I would need this file, and another called 'gcrt0.o' but I assumed that they would be in one of the library archives. Not so. He suggested (this He is Bob Malay, who has been extremely helpful), that they might be found in 'crt0fils.zoo' at a.a, but there is no such archive. So, I ask, where are they. If they are not anywhere, how do I make them? I am so close I can taste it, but I need help. HELP.

Thanks.

The Horizon as I understand is not quite the same old Horizon.
There new partner in the venture, and that new partner won't like to rip Atari User off. Also isn't it nice to have a local dealer?
>
>By the way does anyone think POPULOUS II for $54.00 is steep?
>That's the price they quoted me. If there is a cheaper place
>through mail-order, let me know, thanks.
>
By lokng at the price given in the recent Current note by the rising star, the Populous II is $46 from there, so a local store of $54 isn't unreasonable.
Keep in mind a local store does not have a large customer base and it have to keep a store front. The overhead is larger.
There is at least three Atari dealer in Colorado, Horizen in Denver, Run PC in Fort Collins, and there is one in Colorado Spring. And I think Horizen is aware of that fact.
The Run PC at Fort Collins isn't the cheapest place, but it sure is nice to be able to walk into the store and try out the software before buying it. Chat with them about software and some hardware.
>
> Jeff

Well, just my personal view in term of having local dealer. Keep in mind one thing: A dealer can't survive by not make enough for living.

The basenote talks, unfavorably, of the reopening of Horizon Computers, in Denver, Colorado (where I live).

Horizon has reopened *under new management*, with two people I wish we had more of as Atari dealers at the moment. Right now they're struggling with setting up a store essentially from scratch.

Wouldn't it be more fair to give them a chance to see what they can do instead of immediately labelling them a "rip-off"?

The nearest other Atari store is Run/PC in Fort Collins; they are working (very) co-operatively with the new management at Horizon.

Give 'em a chance, ok?

> and got absolutly no response :-(, I also wrote to Martin (the guy
> that wrote the software) and got no reply from him about it (probably
> because I haven't registered I guess).

I thought m postings were making it out, but in case you missed one,
I have also told people there are no english docs, however, If you look
at the docs for Mercury, which are in English, and run the Hermes docs
through a German to English translation program, and read a few RFC's, you
shouldn't find it too hard to figure out. You should read the config.sys
file, and the xhostd file. These are the keys.

Martin has a job which keeps him on the road a lot, so he's not
ignoring people, just really busy.

5823. Re: FontGDOS released by Atari USA

Newsgroup: comp.sys.atari.st
Date: 1992-06-03 07:01:20 UTC
From: Bob_BobR_Retelle@cup.portal.com
Message-ID: <60016@cup.portal.com>
Source record: 221545

Here's a message from CompuServe's Atari Forums, from Charles F. Johnson
of Codehead Software regarding the recent release of "FontGDOS" ...

#: 63330 S8/Hot Topics
02-Jun-92 11:04:03
Sb: #63323-FONT GDOS
Fm: CodeHead Software 76004,2232
To: bob wilson 72355,1637 (X)

We've gotten several inquiries from people asking if they should now replace
their copy of G+PLUS with the recently released FONTGDOS. Well, despite the
comment in the FONTGDOS documentation about how much "better" it is than the
"GDOS clones" on the market, here's our perspective on FONTGDOS:

There's absolutely no reason to switch from G+PLUS to FONTGDOS; in fact,
there are some very good reasons NOT to switch.

1) FONTGDOS does some really screwy things; without getting too technical
about it, essentially with FONTGDOS, Atari has abandoned their own workstation
structures. Information that was formerly placed in these structures is now
... NOT placed in these structures. (This kind of stuff makes me crazy.) As a
result, since Warp 9 relies heavily on these workstation structures, and the
data it needs is NO LONGER THERE when FONTGDOS is installed, Warp 9's
acceleration effect is cut just about in half when it's used with FONTGDOS.
Argh and double argh. And there is NO WAY to fix this in Warp 9. If you
continue using G+PLUS instead of FONTGDOS, Warp 9 will operate almost twice as
fast.

2) FONTGDOS does not allow you to change fonts without rebooting your
computer. The CPX they call a "Font Manager" is really just an "ASSIGN.SYS"
manager -- all it does is manipulate the ASSIGN.SYS file. If you change your
installed fonts, you have to reboot to actually use the new font setup. G+PLUS
is _still_ the only GDOS replacement that lets you change fonts without
rebooting.

3) FONTGDOS slows down overall system speed by about 10%, which _is_ better
than the old GDOS (although not by much). G+PLUS, on the other hand, slows
things down by no more than 3% ... so G+PLUS is _still_ significantly faster.

4) FONTGDOS is NOT compatible with "every program that uses GDOS" as the
documentation states. In fact, I've been reading messages on GEnie complaining
about _many_ GDOS programs that will not run with FONTGDOS.

FONTGDOS does have a couple of features that G+PLUS doesn't. One is a new
bezier curve drawing function (that no program currently on the market uses),

the other is a font caching mechanism (and all programs that need this sort of thing have long since found their own ways to do it). It simply isn't worth giving up the speed and compatibility of G+PLUS just for these unused features. If you're a G+PLUS owner, stick with it; you made the right choice when you bought it, and it's _still_ the right choice.

>under :(

You're not going to the right shop then.
We get it here on time (before the month starts) from a big
nationwide stationeer here in NZ called Whitcoulls. They get it
off some place over your way in Australia.

Oh yeah, it costs more this way, the other shops still get it late at
the cheaper rate, but a lot of people here must like getting it
early even if they have to pay more, the place sells out quite a lot.

The April issue cost me NZ$21.00 (roughly US$11)

Craig.

Hi all !

Well I got the Specci Emulator for my TT an it works very fine.

But can someone tell me how to get Software from my casettes to
the HD of my TT ? I spent 5 hours by typing a small game for
the Specci (3163 Byte - I remember each). But I want these 48K
Games and don't know how to get them over.

HEEEEEEEEEEEEELP !!!

Ciao
Atarico

Why would they drop FSM GDOS after they finish it? The developer kit
documentation has a users' guide to FSM GDOS, and a guide for programmers
as well. FontGDOS is a scaled down version of FSM GDOS. It doesn't do
the fancy things that FSM GDOS does, but it does a lot more than the
traditional GDOS from the sound of things.

>problems with any other software and my printer...

That's one of the reasons I still use version 2.10, it doesn't
have this problem!!
It seems that with every new version we get a few new bugs to go with
the facilities that used to work fine! It's a shame really, it's such
a brillient piece of software except for the bugs.

BTW: How many people have crashed while transfering data from the
scrollback to the editor??? A few of us here have on many occasions.

Craig.

Oh, I didn't realise they were still under warranty... I would have
thought that all the STE's with faulty DMA's would have been sold
well before now... some people must have big loads of old machines!!

>There are no longer any Atari dealers in the lower North Island, thats how bad
>it is..

It's not that bad... after you're last message about the doom & gloom here
our user group president phoned up the guy from software suppliers,
they are definetly not giving up on the Atari. He didn't want to say
what is going on, but that's understandable, all big business is like that,
because if your competitors found up what every move you make is going
to be then they would get in before you and do something to make it
fail.

Craig.

>The new version should be out in a couple of days.

A few questions Tim...

1. Does it flicker ?
2. Is the ANSI Full ansi? Very few ST term programs are (Uniterm
is the only one i've found that is) i.e. support windowing the text on
screen to scroll only part of the screen either way (up or down),
and update the rest of a line that is being edited. There's probably
more to it than that, but these are the 2 things that really annoy
me.
3. Does it strip the ansi codes out when using the capture buffer?

Craig.

If you have a sound digitizer, you could always play the casette
into a mic. and interpret the stuff as it comes in. I know of at
least one Amiga (paah) Speccy emulator that does that. I'm not
too sure how the speccy stores the information on tape (anyone
know this?), but...

Where is the emulator anyway? Will it run on an ordinary ST?

If I'm not mistaken, the move.l #string,-(a7) should work..You could try

lea string,a6
move.l a6,-(a7)

This should work no matter what....
```

5839. ZX Spectrum EMULATOR how to get software ???

>>the Specci (3163 Byte - I remember each). But I want these 48K
>>Games and don't know how to get them over.

>>HEEEEEEEEEEEELP !!!

>If you have a sound digitizer, you could always play the casette
>into a mic. and interpret the stuff as it comes in. I know of at
>least one Amiga (paah) Speccy emulator that does that. I'm not
>too sure how the speccy stores the information on tape (anyone
>know this?), but...

A friend of mine wrote a spectrum tape loader for the ST.
Works nicely most of the time - we ported a few games, and
the worked perfectly. I don't think he's made a public
version yet, but you could write him at:

Gard E. Abrahamsen
PO Box 71
N-6092 Eggesbones
Norway

He won't be on the net until after the holiday, so you'll have
to use regular mail.

>Where is the emulator anyway? Will it run on an ordinary ST?

Runs on >512KB STs, and executes at .5 - 1 times the speed of the
original thing (Manic Miner plays nicely on regular ST's, and is
identical to the real thing on MSTE's). TT owners gets added
compatibility (flashing and stuff).

It's not 100% compatible (more like 99.9%) - I was pretty disappointed
to find that Jet Set Willy woudn't work. It got to the opening screen,
but wouldn't start the game. Shame.

5840. Re: TOS

Newsgroup: comp.sys.atari.st
Date: 1992-06-03 11:43:51 UTC
From: i921652@redgum.ucnv.edu.au
Message-ID: <1629@sheoak.bcae.oz.au>
Source record: 221447
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Could someone please tell me which versions of TOS are available on
disk? Where can I get them?
Also, on which FTP sites are Atari programs/files available (apart from
a.a.umich)

Replies by e-mail to
i921652@redgum.ucnv.edu.au
(Hope it works properly)

Thanks in advance,

Jared

5841. need some more help with Prospero's Developer's Toolkit

Newsgroup: comp.sys.atari.st
Date: 1992-06-03 12:24:12 UTC
From: scoile@gmuvax2.gmu.edu
Message-ID: <1992Jun3.122412.14132@gmuvax2.gmu.edu>
Source record: 221416

First of all, thanks to everyone who's responded to my last couple of questions, you've been a great help!!!

However...

I still need some help understanding this assembler provided with Prospero's Developer's Toolkit. I find the included manual severely lacking in decent explaination (althought admittedly, I'm new to the assembly programming realm).

What is the OFFSET directive for? How does one use it effectively? WHY would I want to use it?

What are SECTIONs used for? What should they be named? The book implies that the main program should go in a section called .CODE. Is this correct? If I don't put something in the .CODE section, do I specifically need to JMP to the section? What is the .ATAB section for? When would I use .ATAB instead of .CODE?

What kind of start-up code do I need include to create an executable file? Compute!'s Technical Reference Guide on TOS, as well as the example program provided with the Toolkit (only ONE assembler example????) do some playing with the stack before actually moving on to the meat of the program. Is this necessary? I would have assumed that the stack would be correctly set up (i.e. aligned on a word boundry at a valid location in memory allocated to the process), but it doesn't appear that way.

Are there any books anyone would suggest for getting started with assembly language programming on the ST?

Any and all help is GREATLY appreciated. Thanks!

The Amiga emulator is only a p*ss take....it doesn't really work.

I did once however,have a software Mac emulator which WAS real (even if not very good) but this was later declared illegal and withdrawn from the PD.

And I deleted my copy ('coz I'm a good boy).

>without the install). Many have been complaining that FontGDOS doesn't
>work with anything. Someone went as far as to ask if FontGDOS worked
>with anything at all.

Don't you think you're damning FGDOS a little prematurely ? It's the distribution that's lousy, not the program (when you get all of it !). You're right, it will bomb without EXTEND.SYS - try creating an ascii file containing the line : BITCACHE=100000 (or whatever number of bytes you want the cache to be).

The Extend.sys file normally contains a line for FSM parameters, but hopefully FGDOS will not need this bit.

Hope this helps,

Sam.

P.S. I've got FGDOS to work with Degas, EasyDraw and Timeworks DTP so far, but not Hyperpaint !

5844. Re: Write-on and BJ10e

>PD/Sharware and could be emailed to me? Thanks.

Compo sell a BJ Write On driver as an 'extra' for 5 pounds (see the advert in ST Format on the page that offers the manual too). It's a bit of a con, but then the WP came cheap ! I use the Deskjet driver and the output is very good indeed.

Sam.

Publication was delayed by a week. Issue #3 is dated May 30.

There's some confusion about distributability. Issue #3 includes
a file (FontGDOS) that is clearly marked as not to be posted on
BBSes, circulated on user group disks, or otherwise redistributed
without the express written permission of Atari Corp.

I've asked for clarification, and the folks at Atari Corp. don't
seem to know the answer.

> atari if you are in my situation.

You just copy it to a disk and stick the disk in your Atari.

The ST can read/write 3.5-inch disks formatted on the PC. Current versions
of TOS can format disks that are 100% compatible using the Desktop format
option. Old versions of TOS require that you use a formatting utility.

All current Macintoshes come with drives that can read/write Atari/DOS
formats. Look for the Apple File Exchange program. It's probably buried
in the system folder.

5848. LOTUS 2 .MOD music from Am*ga on ST ?

Newsgroup: comp.sys.atari.st
Date: 1992-06-03 13:28:21 UTC
From: bd_g710@neptune.kingston.ac.uk
Message-ID: <1992Jun3.142821.1@neptune.kingston.ac.uk>
Source record: 221448

Are Software houses trying to kill off the ST in respect to games.
I received the other day a soundtracker tune called LOTUSII.MOD
When loading it into a PD soundtracker found the music to be
literally identical to the Amiga music on Lotus Turbo Challenge II.
I can distinctively remember the fact that the ST version has got
a horrible loud beepy tune (alright abnormally beepy) and the Amiga
owners get a thumping soundtracker tune which could have been put in
the ST version as it was only 82 K ! (and not packed)
I am quite sure that Lotus 2 disk is not jam full and could n't fit in this
82 K module so why did they leave it out ????

The only logical reason is that Gremlin Graphics did n't want ST owners
to have this music with their game ! Bastards.

> like them.
>
Speaking of the termcap file, does anyone have an ST termcap file that doesn't map the backspace key to <ctrl-H>? I hate reflexively hitting the backspace key to delete the previous character and always calling up the help window! I would like to map the backspace key to do the same thing as the delete key, and I don't want to assign ctrl-H to delete-previous-char! So how do I tell the termcap file that my backspace key and delete key are identical?

I've gotten most of my emacs functions working on my ST now, including YOW and dired, but I don't know what files I need in order to get the spell checker working. Has anyone gotten this to work on their ST?

Finally, does anyone have any tips to get emacs 18.57 to run a bit faster on the ST? The whole thing seems very sluggish.

Just FYI, I run emacs under gulam.

Thanks!

>

This sounds very interesting! I've always been wanting to hook up a tape drive
to my MEGA. I have a 85MB hard drive, while not huge, still would take more
than 100 floppies to back it up. I have an ICD Mirco adapter with my HD
inside my MEGA. Is the tape drive easy to install? Can you treat it as a
HD installation and simply plug it into a host adapter?

Wouldn't Push Effective Address (PEA) be better? One instruction
instead of two?
Also, is there a chance that there is a problem because the label
'string' is a forward reference? Try moving the declaration of 'string'
up before the first reference. A decent two-pass assembler should have
no trouble with this, but I don't know what Prospero's limitations are.

Roger, do you really know if Atari dropped FSMGDOS or are you just repeating a rumor? I never bought Atari's line as to why FSMGDOS hasnt shipped yet (It doesnt take a year or more to package a program) but I dont have any alternative explanations. You mention that Atari's having legal hassles regarding FSMGDOS. I havent heard about these problems but that could explain the delays. Could you please explain about the legal problems in e-mail?

Ok, I understand one of the reasons Atari decided to ship FontGdos though
I still think its wrong. What I dont understand now is why Atari simply
didnt license G+ from the CodeHeads instead of coming out with FontGdos.

>You're leaving out a lot here - to get the DMA sound of an STe, you'll need SoundBlaster or SoundBlaster/Pro - $199/$299 respectively (not used prices - gee, I can get a used 520ST for <$100 now). I can get an 80 meg with controller for the ST as well for $300. I'll give you Windows for < $100 (providing you get in on the "jump the OS/2 ship" deal), but then your speed increases just went right out the door... not to mention your HD and memory space.
>
You're pricing for SB/SB pro is old. I myself brought SB locally last year for
$169.00 and now they are for $100.00, but why get SB when you can buy SB
compatible for $79.99 locally. SB pro was just purchased by my friend for
$189.99.
520ST is useless with out a drive, monitor. An 80 meg with controller eh?
Go ahead get the 80 meg with controller, but you'll need a case with power
supply with that. You must also be getting SCSI host adapters cheaper than
I am since they run me $72.99 which means it would cost me about $342.99 for
a 80 meg HD with controller/host but w/o casing.
As for OS/2 v2.00, you are wrong about speed, the speed is quite fast even
on SX machines, but memory hogging it is. Windows 3.0 w/ mouse is $89.99.
OS/2 upgrade for DOS is $99.99 from IBM, you don't need windows unless you
want the $49.99 upgrade price.
>No, the older STs are not "state of the art", but 7 years after their introduction, they're still comparable. In 1985, when the ST was introduced, most 7 year old designs were sitting in a closet collecting dust (my old TRS-80 model I comes to mind). MS/Dos clones are just catching on to "point and click" and contiguous memory addressing, and those machines are still over the $2000 mark.

COMPARABLE, ST are like 80286 running between CGA and EGA res. I will give
that ST were ahead of it's time for certain things, but todays tech. it's
lacking in departments.

5861. Kermit and STalker 3.0

Thank's.

Daniel.

5864. 3010 emulation for ST?

Newsgroup: comp.sys.atari.st
Date: 1992-06-03 18:15:23 UTC
From: remyh@cco.caltech.edu
Message-ID: <1992Jun3.181523.16654@cco.caltech.edu>
Source record: 221356

I'm trying to connect to Tymnet, using a 2400 baud modem. I currently use Uniterm, and I can't seem to get it to work. When I log in, there seems to be a really strange translation table error. When I was shown how to log in, the person was using a PC, with a term package called bit-something. Anyway, he was using 3010 or 3101 emulation (don't recall exactly). Anybody have any clues on this? It's supposed to be 2400, 8-N-1. What else could give odd errors?

Thanks,
Remy Hathaway

| Fixing hardware with software? What a novel idea!

Not novel at all. I remember a print head for a high quality printer that came with an e-prom attached. It was supposedly hard to manufacture the printing element so that the pins went to exactly the right spot. The print head was analyzed before shipping, and the e-prom programmed to compensate by timing for any mis-placement, so that the pins to hit exactly where they were needed.

I thought this was a good use of software to solve a hardware problem.

This is probably because the Amiga I believe has built in hardware to play DMA while the ST does not. If you have a normal ST you have probably noticed that playing digitized sounds (which are a big part of Noisetracker, no?) takes up lots of processor time. So, if they put mod playing in the background of the game, they would not be able to make the game itself very fast. However, what they should have done was make it STe aware so that if you had an STe or TT you would get the sound -- these machines can play pretty cool mods in the background with little or no effect on the majority of the processing time.

Ben Gilbert
bgilbert@cs.washington.edu

P.S. - I am not positive that the Amiga has hardware cappacity similar to the STe's DMA sound, but I think it does, after all Noisetracker is from the Amiga.

Well, Atari has demonstrated X-windows running on a TT, but
this was under ASV, the Unix which runs on the TT. I am not sure how
this all ties in with Multi-TOS... Seems to me X-windows and Unix
pretty much go hand in hand, so perhaps the only way to do it will be
if you are running Unix, on a TT for example. For the most part, you
don't need to run X-windows for your own personal use, why not just use
the Atari desktop because it would be much faster. (although X-windows
does make a really really cool terminal... :-)

5872. ZX Spectrum software to ST via MIDI

Newsgroup: comp.sys.atari.st
Date: 1992-06-03 19:38:45 UTC
From: au215@cleveland.Freenet.Edu
Message-ID: <1992Jun3.193845.19828@usenet.ins.cwru.edu>
Source record: 221358

I've just emailed off a small(ish) archive to weiner@atari.archive.umich.edu which allows programs to be transferred from the Spectrum to the ST via the MIDI port. Obviously, you should have a MIDI interface at the Spectrum end. A MIDI lead might help too. You can only transfer unprotected programs less than about 41K - you'll have to hack the others yourself.

zxupload.arc ought to appear in the emulators/ directory of atari.archive within a couple of weeks, with a bit of luck. Please don't mail me asking "What is Atari Archive?", not least because I won't be around to answer from about a week hence.

The Spectrum interface for which the program is written is the RAM Music Machine, which uses the same ACIA (6850) as the ST, as luck would have it. A short type-in listing is included for the Spectrum side of things, with a .TOS file for the ST.

All the source code is in the archive, although modifications should only be necessary for those with a different interface. Even if the ACIA is the same (which is very probable), the I/O ports used might be different. Transmission speed with my setup seems to be about 38Kbaud and I have yet to see a single transmission error (not having tried anything stupid like injecting maple syrup into the MIDI ports beforehand).

Now, about that emulator.. (the following is included in the archive)

If you rename a Spectrum program file on disk, you'll have to take a disk editor to it or the emulator won't be able to find it. The name within the file (byte 0 is file-type, bytes 1-11 are name (padded with spaces)) must correspond to the name of the file on disk.

The documentation claims full implementation of Interrupt Mode 2. This is a teensy fib, because in that case even the most complex programs should run. They don't - Turbo Esprit and Match Day both freeze mysteriously. In the latter case, I went through the code disabling stuff left, right and centre, but only got as far as having the teams running (er, strolling) out.

The R register isn't implemented properly. Many games use this as a primitive kind of random number generator - like Glass and Jetpac. I had to write my own for the latter game (couldn't be bothered with Glass though).

Binary Coded Decimal has been kludged somewhat. The DAA instruction always rounds up, instead of taking the Add/Subtract flag into account. This meant the on-screen timer in Arcadia counted down to 90 and then back to 96!

The only keyboard ports read are those mentioned in the orange manual. Manic Miner and Jetset Willy both use undocumented ports.

Finally, I found that if you hack games and remove all their sound routines, you can speed them up quite dramatically. I had Manic Miner running at about 90% of the speed of the original (this on a plain 1Mb STE) and Horace Goes Skiing actually running faster.

Stephen

>>work with anything. Someone went as far as to ask if FontGDOS worked
>>with anything at all.
>
>Don't you think you're damning FGDOS a little prematurely ?

I doubt it.

>It's the
>distribution that's lousy, not the program (when you get all of it !).
>You're right, it will bomb without EXTEND.SYS - try creating an ascii
>file containing the line : BITCACHE=100000 (or whatever number of bytes
>you want the cache to be).

I managed to get the ACC of FSM (The FSM.CPX file I got is mangled
and does not install) to create an EXTEND.SYS file. Still couldn't use it
with Gemini. It said not enough cache memory, even with BITCACHE=600000!
Anytime I tried to start GEMME.PRG (GEM microemacs): BOMB, BOMB. This
was on a clean system, too.

The really lovable thing about FontGDOS is that as soon as anything
goes wrong, the system locks or bombs.

5874. Problems with Zoo

Newsgroup: comp.sys.atari.st
Date: 1992-06-03 20:01:16 UTC
From: eugene@cs.athabascau.ca
Message-ID: <2279@aupair.cs.athabascau.ca>
Source record: 221365

I tried to post the following message to <larserio@ifi.uio.no>
the author of protect6 (an anti-virus prgram), but my mail was
returned.

Could someone possibly respond to my question regarding problems I
have been having with ZOO21.TTP and a message that I get from
PROTECT6.PRG.

I have just installed protect6 in my auto folder. It appears to be
operating correctly (for example, I get a message whenever I use CAL6.2
(my appointment calendar) that the program is trying to modify
CAL6.2.PRG, since that it the way data is stored in that program.

However, whenever I use ZOO21.TTP, I usually get a message that the
program is attempting to modify a program that is being unarchived.
It doesn't seem to be modifing any of the text or resource files that
are being removed from the zoo archive... just the XXX.PRG files.

Is this likely a link virus? Or does ZOO.PRG interact with zoo
archives in some way that protect6 then identifies.

This is somewhat frustrating to me, since ZOO21.TTP is necessary to
open most newer zoo archives. Thank you....

|> >I welcome any and all information, opinions, factoids
|> >and rumors.
|>
|> [...]

I have had AT-SPEED C16 (16mhz version of AT-SPEED) for about six months, its very fast, if you want to run Windows3/3.01 in VGA MONO on an SM124 it has no problem with that at all, it even runs it at a usable speed. The VGA emulation is a bit unpredictable with most other software that tries to run in it- I have yet to find a PC game which will run in VGA or EGA mode, sometimes you just get a blank screen, other serious type software (NDD and some virus killer utils that run in Graphics Mode give a sort of 'ghosty' picture- not unlike what you see when you load a Degas/Neo lo-res picture to a HiRes screen by mistake!)

Thats the only bad news, but unless you really want to play games- let alone ones for PC's its rock solid. I supports EXtended memory on an ST bigger than 1meg (4MEG ste gives nearly 3meg XMS) and works fine with my ICD SCSI Harddisk, in fact if you get the interleave on the hard disk right (under GEM) the hard disk access times under MSDOS are a might faster than TOS's, sound is a bit of a joke- but then again so is the PC's. with 2MEg+ you can call it as a Desk acc.

Stange Quirks: TC++ crashes at random during a make if it is allowed to use XMS for compilation.

Keyboard repeat seems to ignore MODE.COM so you're stuck with a bit of a slow keyboard.

It is handy being able to call it from a desk acc, but if you can sacrifice the task switching you gain the memory used by the frozen Desktop, and its about 1/3 faster.

Well thats enough waffle- hope this is of use to someone.

Any replies/questions by email as I'm on study leave for exams..

> From: Terry King <tak1@ukc.ac.uk>

What are your views on SHAREWARE ?

I am currently writing two games :

SLAYER - horizontal shoot'em up, smooth scrolling, lots of varied
aliens and LOTS of action and power ups with 'almost'
constant 17 fps.

GRIBBLYS NIGHTMARE - platform game come adventure (early stages so far),
rasters, samples, 25 fps, smooth animation
and foreground masking (walk behind objects).

I really want to know how successful a good game can be as SHAREWARE
(Jeff Minter apparently made 10,000 pounds from LLAMATRON !!).
I have heard many stories of how little people have made from their efforts.
Is this because :

a) The software is crap (sorry.... not very good i mean)
b) It has not been circulated enough.
c) People are dishonest by not paying up (as if !)
d) People do not know how to go about paying in foreign currency.

I want a little discussion on these subjects and would like to know your views,
such as do you use any SHAREWARE software ?, have you paid ??, what is the
right price ?
Also what kind of incentives should there be for paying, such as a pat
on the back, a better version or an extra piece of software ?

Thanks for reading,
Terry

Please reply to news, or to me if you want to know about the games.

5877. NOTICE :: Emacs 18.58

Newsgroup: comp.sys.atari.st
Date: 1992-06-03 21:31:00 UTC
From: skolodzieski@vaxc.stevens-tech.edu
Message-ID: <1992Jun3.163100.1@vaxc.stevens-tech.edu>
Source record: 221380
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hello,

I decided to make this post because of the recent flood of posts concerning the Emacs 18.57 that I ported late last year. It seems that a great many people have a very hard time getting it up and running. The major problems seem to be with termcap entries, environment variables, and UNIXMODE settings.

I have a MUCH improved emacs 18.58 in beta right now. It has the folowing improvements over the old emacs:

1. Screen ouput speed is 3x faster. (Really!)
2. The flow control (^s/^q) problem when text was scrolling has been fixed.
3. External command that are involked from emacs, (like in dired) are search for along the PATH.
4. A termcap file does nopt have to exist. There is a default termcap entry compiled in! If a valid termcap file is found and the TERM environment is set properly, emacs will use the termcap file. This is especially useful for those who run second terminals off the ST through the serial port under MiNT. Personally I have a VT220 attached to my ST :)
5. The "M-x compile" command now works great, it does not need to spawn a second shell, it writes its output to the correct buffer, and one can step though the compiler error messages with "M-x next-error".
6. A generic external process interface is in place, since we are still single tasking, no external input is allowed, but if something (like grep/ls/fgrep/gcc, etc...) runs to completion with no input, then these may be convienently launched with ouput going to a buffer.

These are the highlights! There are numerous subtle changes also. I will try to put together some sort of decent TeX documentation on installation and dumping, then package it up and send it out. Look for it in about 1-2 weeks.

Cheers,
Scott Kolodzieski

check if djpeg creates GIF87a or GIF89a files and if giffer can do '89 files.
i found this out when i took a .jpg file thru xv to make a gif. i was able
to change the magic number to GIF87a with a binary editor and it worked fine
(with mgif).

5880. Tape Drive

Newsgroup: comp.sys.atari.st
Date: 1992-06-03 22:58:50 UTC
From: Bryan.Hall@f2703.n206.z1.royaljok.fidonet.org
Message-ID: <707790675.F00001@royaljok.fidonet.org>
Source record: 221245

If you are looking for a GREAT deal for a tape drive, to keep from having to do those deaded floppy backups, check this out...

Computer Service Experts (CSE) is selling Tandberg 3660 tape drives (used) for only $199. Thier Address is: 1920-G Lafayette St., Santa Clara, CA 95050-3956. Thier phone # is: 408-988-8492.

I ordered a drive last wednesday afternoon COD, and it arrived on Friday. I modified (had to add yet another SCSI connector) my SCSI cable, pulled the block jumper of parity, and stuck in on the ID address so that it was set for ID#4. Hooked up the power (this is all in a tower case), and powered it up. The only hardware problem was the little mechanism that keeps stupid people from putting a tape in backwards. I had to slightly flatten it with a pair of pliers, and now it works perfect.

Of course you need to get some software to drive it. I called up a European ST BBS (14.4 weekend) and DL'ed TAPEBIOS and the GTAR zoo files, unzoo'ed them, and installed the TAPEBIOS.PRG in the autofolder allong with it's SCSI ID file. Simple!

Next, to try it out.. I slipped in a 3M DC6252 tape (512Mb but will work just as good as a DC6250 - just higher density particles). I tried out the dump program (with TOS) and achived about 5Mb/min backing up my 213Mb Maxtor MX213S. I then tried out the tar program (without compression - again with TOS) and achived about 1.9Mb/min. Not bad for a 250Mb QIC tape drive (and a 8Mhz Mega ST - come on GBS ;^).

Although I have no problem with CLI commands (been using Unix for quite some time), average users may not care for the "cryptic" interface (I like it ;-). So... I am planning on using the C source code for TAR and slightly modifying it (understand drive devices without Mint/Multitos), add inline compression, as well as a nice GUI for the non-cli types.

What can I say.. For $207 (with COD and shipping), I am VERY pleased with this purchase. It is a pretty silent drive, at least compared to some of the ones at work, and is reasonably quick. It sure beats floppies! Just set it to back up your HD and walk off until it is finished.

> The really lovable thing about FontGDOS is that as soon as anything
> goes wrong, the system locks or bombs.

I had similar problems. The error-handling of FontGDOS is about on the
level of micro software that you might have encountered in 1982. When it
gets confused, it crashes (sometimes after giving you the courtesy of an
error message, and sometimes not).

I recall somebody saying recently that GDOS fonts come in two flavors,
Motorola and Intel, and that real GDOS won't digest one of those flavors
while AMCGDOS isn't so picky. If that's the case, it might account for the
case in which FSMGDOS gives that error message about not enough cache
memory. It does not account for the bombing -- that's just unacceptable
program behavior.

>---

There are 2 versions of Atari ST emulator available for the Amiga:
a German version and an English version. I used to have both of them.
I think 2 versions function the same; the difference is just the text.
They emulates 3 resolutions (Low (color), Med (color), and Hires (mono))
on an Amiga screen. When they boot up, a simple menu comes up with
3 options of 3 resolutions. Since they come with TOS 1.2a as soon as
you click one of the options Atari comes right up for you. These emulators
work about 80% of the Atari software. Unfortunately, most of the commercial
games wont work; however, some applications work fine. I downloaded a whole
bunch of PD stuff including games; they work fine (most of them). The
speed ,I would think, is about 75-80% of an ST520 (I used to have one
of these). When the emulator is running, the Amiga drives become
Atari DD drives; they read/write Atari formatted disks (I tested this).
No sound is supported nor the serial/parallel lines. Too bad that these
emulators only run on an 68000 with 2 drives.

>I really want to know how successful a good game can be as SHAREWARE

Blox, which has been on atari.archive for several months, has gotten one registration. You may draw your own conclusions. One thing that can be said, though, is that that one person has my utmost respect and appreciation. I will buy that person dinner next time I'm in Europe. :-)

>(Jeff Minter apparently made 10,000 pounds from LLAMATRON !!).

I think this is an exaggerated account, but even if it is true, it's not a good idea to use the absolute maximum as an index. The minimum is zero.

>I have heard many stories of how little people have made from their efforts.
>Is this because :
>
> a) The software is crap (sorry.... not very good i mean)
> b) It has not been circulated enough.
> c) People are dishonest by not paying up (as if !)
> d) People do not know how to go about paying in foreign currency.

I invite speculation on a, b, and c with respect to Blox, since I'm obviously a bit biased. In my experience American ST users will not pay for shareware, so I doubt d is a problem. (Again, *in my experience*. Don't get huffy; your milage may vary.)

>Also what kind of incentives should there be for paying, such as a pat
>on the back, a better version or an extra piece of software ?

Since you raised this discussion in the context of games, I'll mention a few specific things about shareware games in particular: Games are the worst things to do as shareware, because there's no concept of a useful upgrade. If the game is fun, who needs the upgrade? If it's not fun, who will register? I tried the upgrade approach with Blox and it obviously has had little effect.

If you have high hopes, shareware is depressing in the ST world. In my experience, you're damn lucky if you get a single email note of appreciation for something you release as shareware (or even freeware). My impression is that most people just don't really give a crap about the person who wrote the software they like, as long as they can get the software for free and it does the job. Shareware and freeware is really taken for granted. Note that I'm not making any kind of moral judgement here.

If you go into this expecting to make any money, you will end up disappointed if you're lucky, and bitter if you're not. And the worst part is that if you, as a shareware author, complain that you're not getting registrations, you'll get a barrage of excuses and accusations from the user community. I read a column in some Atari magazine a while back where the author actually had the gall to blame shareware authors themselves for the ridiculous lack of registrations in the ST community. The claim was that shareware authors don't "get excited enough about their products and don't promote them well enough." What a load of crap. My opinion is this: you download, you like it, you pay for it. Or you don't, if you're not someone who believes in paying for shareware. But it's the number of people in the latter category that determine the success of shareware in the market. Shareware authors should not be expected to buy ads or run toll-free tech support lines just to get registrations.

The other kind of abuse that grousing about lack of registrations will get you is the "well your programs suck; Jeff Minter's made 10,000 bucks so obviously it's a problem with YOU." This usually doesn't make for constructive argumentation. :-) The real problem with the Jeff Minter cases is that they mislead unsuspecting shareware authors into thinking they'll actually get compensated for their time, or that they'll actually make money. Then they're disillusioned when they put their program up and don't get any registrations.

My advice: always assume that when you write something that's shareware you're working for free. And make a mental check of where you stand on the issue from time to time; there's a point beyond which writing professional-quality or near-professional-quality software for free becomes almost demeaning. Until you reach that point; i.e., as long as you're enjoying the programming itself (and not just reveling in the fantasies about all the money you think you'll make), you'll love writing things and putting them out there. That point is surely determined by personal factors. Beyond that point writing shareware is probably just going to make you feel used.

5885. TIGERCUB.ARC uploaded to A.A

Newsgroup: comp.sys.atari.st
Date: 1992-06-04 07:00:36 UTC
From: takem_b@pyramid.unr.edu
Message-ID: <3877@equinox.unr.edu>
Source record: 221372

I've just uploaded the Tigercub demo to atari.archive (TIGERCUB.ARC)
so it should soon be appearing to the newitems directory pretty soon.

TIGERCUB.ARC is a KCS Tiger Cub Demo. It can give users an idea on how
the MIDI interface with TIGERCUB (a scaled down version of TIGER and
the KCS environment) looks and feels. It should be fully functional
except for any save options... Remember that it is only a part of the
KCS environment and the full blown editor / recorder.

Remember to Experiment with holding down the Ctrl, Lshift, Alt, Rshift
keys when moving the note stems with the mouse (or other keys). Other
key combos react differently and when you use them, you actually have a
LOT more editing power. Play with it for awhile and take a few days to
get used to it... ^^^^^^^^^^

KCS Level II has a lot more and it is different, but this will give you
a feel (that's somewhat close) to what the KCS II stuff looks like.

Have fun!

PS. Remember that you can't save with this version since it is a
demo, but it'll at least give you an idea of what is going on
with the KCS stuff. BTW, does anybody have or know of a demo
for Cubase?

TONY D'ALFONSO asks, regarding emulators:

> Well, with such an emulator for the Amiga, why can't there really
>be one Amiga emulator for the ST?

The problem is, the Atari ST is a fairly simple computer. It can
be emulated in a rather straightforward manner.

On the other hand, the Amiga is rather complex, being built around
a custom IC chip set, similar to the Atari 800 series.

It's very difficult to "emulate" the functions of separate
coprocessor chips like the Amiga uses in software alone.

It might be done, but running on a normal 8 Mhz ST, it would be
so slow as to be useless...

Source record: 221375

I guess it was an OK program (I bought it last year) but its copy protection is flaky as all hell. I installed it on my hard drive, following their instructions. Even with this installation you need the original floppy to run the program. Fine. But, at one point when I tried to start it up, it flashed an obnoxious message about how I should be ashamed of pirating their program and it promptly started writing on both my floppy and hard drives.

Ahem. I bought the damn program, and was running with the original disk. Since the stupid license agreement told me it would be illegal for me to make my own backup, and I had to buy a backup disk from them, I had not made a backup copy prior to using it. This fucking program had started deleting not only the stuff on the floppy drive but also on my hard drive.

As a MIDI program it seemed pretty capable. But that bogus copy-protection shit has got to go. As far as I know it decided to eat my drives just because the rotational speed on my floppy drive was a little off. Hell if I know why it would decide that the original disk was a pirated copy. The program also wouldn't run when the floppy was write-protected, so there's no way to protect myself at that end. What a bunch of crap.

After recovering from my initial shock and outrage, I was able to restore the contents of my hard drive and pull out a sector editor to examine the stupid floppy. Looked like it only trashed the boot sector, and left the subdirectories and actual file data intact. Or maybe I just hit reset fast enough to prevent total destruction. At any rate, since I had paid $100 for it I wasn't about to be shafted another $10 for a backup disk. I made a sector copy of the disk and managed to recreate a boot sector and most of the FAT and root directory on that.

Ironically, I now can only run the program off my copy, the original disk seems completely trashed. What utter rot. TigerCub was my first Dr. Ts purchase, and it is certainly going to be my last.

I don't know if you checked this, but did you use the -G option when
using djpeg? The default format for djpeg is to put everything in ppm
format; the -G option tells it to put it into gif format.

5893. Re: Backing Up Minix Partitions

>If this isn't possible - how do you back up the Minix partition from Minix? Tar
>doesn't handle multiple volumes.

>Bob Malay
I make backup's from my minix-partition under mint.
The best way to do this is:
boot your computer with mint and minix-filesystem driver
and then use your favorite Backup-Program (like BackupST or DiamondBack II).

My computer always run with mint and minix and i don't have any trouble.
I have one Partition normal TOS to boot the computer and start mint,
all other Partiones (i have 3 Partitions on a 60 MB Harddrive) are minix
Partitions. So i can use long-Filenames and normal UN*X-like file-modes.
(I use the multiuser enviroment).
I must say: it's great!!

Greetings
Joerg

I think your problem is how to start Kermit from STalker. The solution is
quite simple. You can start Kermit with a Backtalk routine called
run_program (). Compile the Backtalk script and install it in the Backtalk
menu. I think this should work.

I think Lattice C5.5 allows one to do this with their S-Record support.

5896. Re: FontGDOS released by Atari USA

Newsgroup: comp.sys.atari.st
Date: 1992-06-04 10:19:24 UTC
From: hrs@aber.ac.uk
Message-ID: <1992Jun4.101924.18507@aber.ac.uk>
Source record: 221383

I've been following the FSMGDOS saga for the last, must be almost 3
years, and along with many people I am growing more impatient by the
day. *Every* other platform has a decent font-handling-output
mechanism, except Atari. So I thought I'd write in some information I
have (from a legit source) on FontGDOS and FSMGDOS and a possibly
interesting alternative to our problem.

First the info:

The following list of new VDI calls for FontGDOS and FSMGDOS may
go some way to enable people to differentiate between the two:

GDOS+FontGDOS+FSMGDOS calls:

v_pgcount (set number of copies for laser printer)
vq_gdos (get GDOS version number)

FontGDOS + FSMGDOS calls:

v_bez (draw bezier curve)
v_bez_con (control bezier facilities)
v_bez_fill (draw filled bezier curve)
v_bez_qual (set bezier quality)
v_set_app_buf (reserve bezier workspace)
vqt_devinfo (inquire device status info)
vqt_f_name (get font name and index)
vst_error (set FSM error mode)
vst_scratch (set FSM scratch allocation mode)

FSMGDOS only calls:

v_flushcache (flush FSM font cache)
v_getoutline (get FSM outline)
v_killoutline (kill FSM outline)
v_loadcache (load FSM font cache from disk)
v_savecache (save FSM font cache to disk)
vqt_advance (inquire FSM advance vector)
vqt_cachesize (inquire FSM font cache size)
vqt_f_extent (find size of graphics text)
vqt_get_table (get pointer to GASCII tables)
vst_arbpt (select arbitrary point size)
vst_setsize (set cell width to arbitrary point size)
vst_skew (set FSM font skewing angle)

Clearly there is a close relationship between FontGDOS and FSMGDOS, so
let's not all be so disappointed with FontGDOS. However, having said
that I have to admit I've not tried FontGDOS, I hope in the next few

months to have a go with the bezier stuff. ST Club seem to be distributing FontGDOS as far as I can tell.

Now for the alternative solution:

The big problem is we *still* don't have outlined fonts. There is one package in the UK (and I believe now also is the USA) that does support outlined fonts and that is Calligrapher -- the word-processor. I don't have a copy of this myself but as they are improving the program month by month I am beginning to get interested, for the following reasons:

1: Calligrapher uses a form of GDOS that can handle outlined fonts.

2: There are *loads* of fonts available.

3: They supply many drivers which work with the special GDOS....

4: .....including a postscript driver, I am to believe that Calligrapher has the first Postscript driver for 'GDOS'?

5: From various reviews etc, people say that the output quality is excellent from Calligrapher.

What would be really neat is if we could all hook into Calligrapher's special GDOS so as to gain access to the outlined font etc technology.

My question is how? Perhaps it's impossible but it wouldn't it be great not to be dependent on Atari junkware/vapourware.

If anybody has any other info on this topic or I've got completely the wrong idea, then do let me know.

5897. .zoo atari->vms and vice versa

Newsgroup: comp.sys.atari.st
Date: 1992-06-04 10:57:55 UTC
From: minidis@urz.unibas.ch
Message-ID: <1992Jun4.105756.25278@urz.unibas.ch>
Source record: 221384

Hi,

I want to transfer atari zoo-archives to vms-vax and use the files there
and vice versa, use vms zoo-archives on my atari.
But the only thing that happens when uncrunching a message saying
that a corrupt archive is beeing used.
Atari zoo: V2.01b (or 2.1b I not sure) date: dunno
vms zoo : V2.1 date: 91/07/09 02:10:34

So much for compatibility, or what ?

> least one Amiga (paah) Speccy emulator that does that. I'm not
> too sure how the speccy stores the information on tape (anyone
> know this?), but...

I managed to hook up a cassette drive to the Centronics port (used the BUSY input) and to retrieve about 5% of my Spectrum software with a hacked-together tape loader. The other 95% wouldn't load, either because the tape drive didn't work (it's a wreck) or because I didn't get the sync pulse recognition right. If anybody is interested, I could supply the tape loader source code.

I'd simply *love* to play ALIEN 8 again. Not much luck there, it's copy-protected and I didn't keep a cracked version :(

Sigh,

Jens.

I'm not experienced in programming X windows, but from a few books
I glanced through on the subject, it would seem, given the posted specs
for the new Falcon, that a X emulator using the VDI would be possible,
given the better resolution and colour. Whether it would be fast enough
I guess remains to be seen.
Would the 56001 dsp be usable as a blitter/graphics co-processor? Is
there any way it could be connected in the machine in such a way that it
could not handle graphics tasks?

Message-ID: <1992Jun4.134719.1@neptune.kingston.ac.uk>
Source record: 221388

There is no Amiga emulator available for the ST at the moment
because as someone mentioned it has so many custom chips inside
that it would be almost to difficult. Why emulate the Amiga anyway ?

There is a fully functional ST emulator in PD for the Amiga. It is
German and I think is a complete copy of TOS disassembled and re-written
to be more compatable. I think its for 1 meg machines and you need an
external disk drive.
There is quite alot of software that still works with it. I think it
is mainly GEM applications such as Autoroute (but thats VERY slooooowww)
also it does show some of the spectrum 512 slideshows as well for some
reason !

Message-ID: <1992Jun4.135958.5355@ryn.mro4.dec.com>
Source record: 221259
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Now that Mega Stes are available with 1.44 M floppy drives, I have a question that someone who has used one may be able to answer:

I have heard all kinds of stories about compatibility between 720K and 1.44 M floppies on IBM-PCs, mostly that 720K disks formatted on a 1.44M drive may not be readable on a 720K drive. I currently have no dire need for the 1.44M drive (in fact I can save about $100 by buying a Mega with a 720K drive instead) but am thinking of the future. If it will cause compatibility problems with the 720K drive in my 1040 then I'll pass.

Comments?

When I did the first port of umoria to the ST, I asked for postcards an got a fairly encouraging bunch of them. When I did an update, I included the same note, and got a lot less. One amusing point is that both efforts got picked up by magazines for freebie collections, and the notes were included, but nobody mentioned the magazines on the postcards.~r I guess the moral, if any, is that magazine (and I suspect PD disk library) distribution is unlikely to be the part of shareware distribution that gives you the best response. GEnie and the networks are probably more likely to be rewarding. I would guess that ftp archives are going to be particularly unrewarding because so few people with actual money have easy access (ftp is one place where students get a worthwhile break).

It's not a virus; it's just PROTECT6 warning you that an executable
file is being modified. The modification is being performed by ZOO,
so all you need to do is strike a key so ZOO can proceed.

<< all other stuff deleted >>>

Terry, read Dave Bagget's response to your query. Then read it again. Dave catches a lot of flack in this newsgroup for expressing his straightforward viewpoints but he's really captured the essence of the shareware problem in this reply. If there are users out there who take offense (offence in U.K.), well, I'm sorry if the truth hurts but we (as users) have brought such hard times upon ourselves.

Terry, I'll "ditto" everything Dave said but let me add one more thing: If you think your games are commercially viable and of high quality when compared to the current crop of commercial offerings and you feel you have simply invested too much work into them to _give_ them away, then market them commercially. A shortcut way to do this is to try to sell the software to one of the European magazines with a cover disk, like ST Format. You don't get paid much but it's quick and easy. Unfortunately, with the death of Start, US Atarians have no such outlet. If you want to sell your software, you can either do it all yourself (tremendous workload and start-up expenses) or license it to someone else (minimal work on your part but less income potential).

Send me email with a description of your games and let's talk. I can at least give you some advice (take it or leave it... it's free) or send you in the right direction, at least.

^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^

Ah, c'mon Simon. I know LOTS of people who would be very interested in an inexpensive Amiga emulator for the ST for no other reason than to play some of the great games available on that platform. The problem is, the reason why manyof those games are great is because of those custom graphics & sound chips in the Amiga's guts which no one is going to emulate via software and still be
(a) fast enough,
(b) legal, and
(c) inexpensive enough to entice sufficient Atarians to buy it.

You can bet the ST emulator for the Amiga is _not_ licensed for Atari's TOS!

Howard, I've read lots of your flames in this forum, so now it is time for me to clear up some misconceptions.

First, I am sorry that you had problems with V. 1.0 of Tiger Cub.

Second, I don't work for Dr. T's and am not related to them in any way save that I use Tiger Cub, which has just been released at V. 2.0.

The new release of Tiger Cub is not copy protected. NOT COPY-PROTECTED. NOT COPY-PROTECTED.

And, did you actually call Dr. T's when all this went on? What did they say to you? When I've called them, they have been very nice. Once I wrote them and they responded quickly with a nice (but not the answer I wanted to hear at the time:-) response.

The new release doubles the sequencer tracks available, adds sys-ex editing and also allows the sequencer to sync to MIDI time code and Song Position Pointer. A program to view and print sequence data in sheet music form is included (I haven't used the new version of this yet, but the old one was very handy twice, once to pass some music on to a violinist friend of mine and once to clean up a "very difficult passage" in a piece I was writing:-).

I've used Dr. T's products for a long time now (since I bought my ST back in '86 or '87) - I've had some problems but they have almost always been very helpful (the only time I had problems was trying to get their file format so that I could write some tools to fix some files I had purchased from them - I dumped some files and figured it out for myself, something I've done a lot over the ages - I wish vendors would simply document their file formats directly).

To correct something said earlier (by the originator of this thread), Tiger Cub is not part of KCS or even related. Tiger is the graphic editor for KCS; Tiger Cub is a standalone sequencer that runs in the MPE environment (this allows you to run multiple programs from "inside" one - a context switching scheme which can also share memory for sequence and other data). Tiger Cub replaced the MIDI Recording Studio (TM) from Dr. T's - MRS was the Dr.s entry-level sequencer based on the original KCS technology (editing music like a word processor - for some kinds of things it is great, but for most a

graphic environment is better IMHO).

I upgraded my Tiger Cub to V. 2.0 as soon as I got my notice in the mail. I am really, REALLY satisfied with this release - it does exactly what I want and need it to do. The only thing I wish it would do is convert old MRS files done at the default 24 steps-per-beat resolution to the new default resolution of Tiger Cub - perhaps I can do that via Standard MIDI Files (anyone have such a program? I've considered writing the code based on the converters between text and Standard MIDI File formats posted recently to the archives).

Anyway, just wanted to clear the air on both of the above counts.

Have fun! - Bob

>vms zoo : V2.1 date: 91/07/09 02:10:34

>So much for compatibility, or what ?

The problem comes from the various file types which are possible in
VMS, not from the archives or ZOO itself.

We have a VMS cluster and a UN*X cluster here, with DECstations
running ULTRIX in the UN*X cluster. The DECstations can talk to the
machines in the VMS cluster via DECNET. I can pack a ZOO archive on the
VMS cluster and transfer it to the UN*X cluster using DECNET copy in
binary mode. The archive can then be used without problems by any of
the machines in the UN*X cluster. The whole thing also works the other
way around. It does NOT work via ftp, binary mode or not.

Once I've managed to get the ZOO archive correctly transferred to the
UN*X cluster, I can use a SONY workstation in the cluster to copy the
archives on a 3.5'' floppy. I can then use them normally on my Atari
Mega ST at home.

This doesn't help you a lot if you don't have a setup like the above
available. I have not managed to transfer ZOO archives directly from
Atari to VMS or vice versa using Kermit (the one built into Uniterm).
I just want to point out that this is due to ZOO and Kermit using
different file types on the VAXen. It's quite possible that another
transfer program, which might use a file type compatible to the one
used by ZOO, would work. It might also be possible to convert the file
from one type to another, but so far I've not figured out how.

As an aside: When I ftp an archive from a file server to a VMS
machine, it might not be possible to use it there, but after
transfering it to my atari it's perfectly OK!

Good luck!

What is the difference between Populous II and Populous, The Promised Land? I've seen the latter advertised for $19 in Rising Star. Is it like Lemmings II, in that if you have the original you only need a data disk, but if you don't you can still get a complete version of the sequel game?

Have n't heard of it that way before.

> Where is the emulator anyway? Will it run on an ordinary ST?

Yes.

There are two floating about. One with Jetpac and the other with poole.
They both are German I think and use different methods of transfering
software, one gives instructions on how to build a dongle to transfer
information via a tape recorder. One of the emulators is for 1 meg
machines only for some reason !

Both are available in PD but I don't know their ftp location address.

> Daniel.

That's really a matter for the linker rather than the compiler.
I don't know of a linker that can do this, but the way I would approach
it would be to get the relocatable program from a normal linker and write
a program to relocate it at the required address (Exectuable file formats
have been posted recently) and then save it for putting onto ROM later.
The startup code would have to be changed to do things like copy the
variable data section (I forget it's name) into Malloced RAM instead of
Mshrinking.
If you are thinking of making a cartridge then these have a special
format which I have seen (badly) descibed in ST Internals.

It would be nice if people checked that there wasn't already 200 replies
to an item saying exactly the same thing before writing their own (Not
getting at Wolfgang in particular).
By the way, I still maintain that PEA string(PC) is the best way since
PC relative addressing is two bytes shorter (and consequently faster).

It could be that you're encountering the record format problem. VMS ZOO is expecting the file format to be Stream-LF, whereas if you ftp to a Vax the file is quite likely to end up in 512-byte binary record format. Zoo should have come with a program called bilf, which you can run on your vms file (syntax: 'bilf l foo.zoo') to convert it to stream-lf. I have found that if you're just going to d/l to an ST this step is unnecessary; i.e. the ST version of zoo handles it either way.
Hope this helps.

Populous II is a totally new game based on the general theme of God-like powers of the original version but greatly expanded to include numerous new capabilities and much improved graphics and animation. It's available in both 512K an 1Mb versions and I'm told the 1Mb version graphics are much better, but I can't vouch for that since I have not seen the 512K version in play.

>I've asked for clarification, and the folks at Atari Corp. don't
>seem to know the answer.

I'm fairly certain that Ron Kovacs of Z-Net cleared up the confusion on GEnie. The answer is that AEO #3 and the FONTGDOS archive contained within it can definitely be distributed and posted on BBSs. The separate FONTGDOS archive (the one that's 400K) cannot be distributed; you must get it from GEnie.

Hey, I know it's confusing, and they (AEO editors) regret the problems. It's a new magazine with some new ideas, so give 'em a little slack. :^)

I have been out of the loop on Atari for awhile. Whats going on?

I have a 520st that I've had for four years. Its been collecting dust for almost 2 of those years because I just could not get excited about a seemingly dead product by a seemingly dead computer company. Plus I've had a Sun sparc-station clone at home for those two years and it has been a much more exciting computer to play with.

Anyway A few weeks ago I powered up my ST and actually had fun writing a GFA application. Now that I've discovered fun in my old system again I was wondering whats new in the Atari world, like....

Whats the latest hardware offering?

Are there any upgrades to the 520St that are worth anything?

Does Atari have multi-tasking yet?

What rev is GFA basic at? (I have 3.1)

Does Atari still treat folks like sh*t?

Where is the Atari focus these days?

Any other news thats note worthy?

Thank you for the halp

Steve Matson....

I'm a big fan of shareware, and several of my most often used programs
are shareware. They include:

Little Green File selector
Pinhead
HotSaver
DTerm
Llamatron
Arcshell

and yes, I've registered for all of them (twice for Arcshell!).

I've written several "free" instrument profiles for Dr.T's X-oR MIDI
system exclusive/patch editor/librarian program, and have been thinking
about distributing my next one as shareware. It's occurred to me to
"cripple" it, or put a big, nasty text box in the corner stating that
this profile hasn't been registered, but I'm not sure I want to deal
with the abuse...

Frankly, when I see how many people with ST's use pirated software, it's
not much of a surprise to find out that few register for shareware. A
shame really, because how many other products can you fully try out for
as long as you want before you decide that they are worth paying for?

>seems completely trashed. What utter rot. TigerCub was my first Dr. Ts
>purchase, and it is certainly going to be my last.

It seems the market has spoken...people objected to the copy protection,
and the manufacturer removed it. You gonna continue to boycott them out
of general principles?

I'd think that users would do well to support companies that respond
constructively to customer feedback. Dr.T's has always been very
responsive to user feedback, and as a result every software upgrade has
shown intelligent improvements. Last week I spent over 80 hours using
my KCS Omega/X-oR/Phantom setup without a single glitch, and I've got
all kinds of desk accessories, screen accellerators and AUTO programs
installed. Even the "elite" sequencers (Cubase and Notator) can't boast
that kind of compatibility.

Cross-posted to: ont.micro,kw.micro,uw.sys.atari,comp.sys.atari.st,comp.sys.atari.8bit

In June, the Kitchener-Waterloo Eight Sixteen Thirty-two (KWEST)
Atari user group will have a general meeting with the spotlight on
the ST Library.

Our 16-bit library currently has over 400 disks of public domain
and shareware software.
In addition, there will be our updated catalog disk and our
disk-of-the-month.
Our 8-bit library is also available at this meeting.

As well as our own newsletter "The Hard Copy", we will also give
attendees the May (& perhaps June) issue of AtariUser.

The group welcomes new members and visitors with
8-bits, 16-bits, or those just curious.

Meetings held at the University of Waterloo in the
Math & Computer Building.

Room opens at 7:00 pm. Meeting starts at 7:30 pm.

Wednesday, June 10, 1992
DCS Course Room, Room 2009 (2nd floor)

Call 579-3695 for more information.

Hope to see you there,
Dani Roloson

> I have been out of the loop on Atari for awhile. Whats going on?

Basically the usual. Atari Corp. continues to head straight for Chapter 11 in terms of earnings. Users are still religious about their machines, and there are still regular Amiga vs. Atari squabbles here. Good software is still limited to niche markets. Shareware development utilities are usually better than their commercial counterparts. The GNU stuff gets ported quickly, and runs under MiNT, so most Unix types among us are still happy.

> Does Atari still treat folks like sh*t?

Good Lord, if you only knew...

There is some rumored new hardware. Of course, we've heard this all before, but who knows. In general, there hasn't been nearly as much activity within the Atari community these past two years as in 1987 or so.

>Thanks for reading,

Well, I have so far registered two programs: Llamatron and Revenge of the Mutant Camels, both by Jeff Minter. The currency problem was solved easily since Llamasoft takes Mastercard, although I would have found a way around that if I had to (calling at 2AM local time was the biggest hassle in that area :-) I registered them because there was incentive: they sent me a piece of software for each registration (Andes Attack and Gridrunner, I'm glad I did it...) I understand that Jeff has another title coming out soon and I do plan on looking at it. I will register if it's good even if there is no 'incentive' because I have come to appreciate this guy by the quality of his stuff, plus his newsletter is a kick in the pants to read also. I think that the 'better version, this is just a demo' approach and the other software approach are almost necessary or people just won't, I know I probably wouldn't have.
I will be registering things in the future, as Llamasoft made this a good experience so I won't be as reluctant to for a good piece of software.
I think that once people get started registering things they will continue to, that's the case with me (Freeze Dried will be registered to me very soon now.) I think $5-$15 is fair for most programs, more than that is too hard to get from folks, and the extra volume will make up for the smaller fee.

Just my viewpoint.

5932. July ST Format

Newsgroup: comp.sys.atari.st
Date: 1992-06-04 21:17:22 UTC
From: samm@aisb.ed.ac.uk
Message-ID: <1992Jun4.211722.420@aisb.ed.ac.uk>
Source record: 221268

Just got the new ST Format, with Kumana's K-Spread2 on the cover disk. It looks OK, though I think it's rather outdated now isn't it ? (spread-sheets ain't my speciality). Shame they sold-away their souls and can't give games away anymore.

Interesting snippet in the news section - Moriarty software claim to have produced a screen emulator for all 3 TT resolutions that works on a bog-standard ST using a scrolling window - bet that fair zips along :-)

I also had a chuckle at the audacity of Commodore - they have a 2 page advert for the Amiga 600, offering 'the computer you always dreamed of' !

The main feature is '50 ways to upgrade your ST' - most of it is the usual 'comprehensive round-up' drivel that they churn out every 3 months, though there are some interesting areas on expensive hardware bits - Overscan, Crazy Dots and the like.

Next month's extra disk is supposed to be 'Something to get you writing games' - I hope it's not that bleedin' awful 'Animaster' thing they produced, and I doubt it's STOS...SEUCK would be pretty good though (rumour mongering again !)

Sam.

5933. LZH201?

Newsgroup: comp.sys.atari.st
Date: 1992-06-04 21:30:58 UTC
From: cs902117@juno.ariel.yorku.ca
Message-ID: <1992Jun4.213058.4495@newshub.ariel.yorku.ca>
Source record: 221276

Which ftp site is the latest version of LZH? I got a version lzh201i.lzh, which came from terminator.cc.umich.edu, and I had a problem extracting it last time... Will try extracting it again... Lately I have been having problems with software from that site... Hmmm...

/ o n y.

P.S - Lately my machine has been acting weird... The mouse would occasionally screw up that when I pull up, the mouse cursor goes down, and vice versa.

5934. Amiga emulator?

There are two 'amegia emulators' floating around. Both unfortunatly have the same name, which is the cause of much confusion. One is indeed a joke, try anything and the 'guru' pops up. The other is only a joke if you try to do anything. It "bombs" a LOT! I deleted my copy about a day and a half after I got it. Things run, just not for very long, and for disk I/O you're limited to

the 'standard' IBM/Atari scheme.

>Especially if there is an Atari ST emulator out there for the Amiga. I
>can almost assure you that one exists as a friend of mine was asking for a
>copy of TOS if I had it on floppy to load in the ST emulator on his Amiga.
There are (or were) three different ST emulators for the Amiga. All three are/were illegal. Atari notified all the makers to 'cease and desist' threatening them with legal action if they continued. One, if memory serves, 're-worked' their code so that it ran off of TOS ROM chips instead of a TOS on disk, and that was the last it was ever heard of. In most circles anyways.

Huh? I was there not too long ago. I was in Denver on business, saw the sign, and stopped in. Even bought something there! I had a nice long talk with one of the owners, rather pleasent, really. I didn't think their prices were out of line... Heck, they've got more _on_hand_ then most places! Racks and racks of stuff! I even brought back a discount offer from them for the local Atari group here in Minnesota! (We have a local store and want to keep it, so..., but it was nice of them to offer it.)

5937. Atari stuff for sale

Newsgroup: comp.sys.atari.st
Date: 1992-06-04 23:04:35 UTC
From: eggert@sun.lclark.edu
Message-ID: <1992Jun4.230435.24043@lclark.edu>
Source record: 221274

For sale: $500 Takes all, or split up as follows...

Atari 1040 STf - $200
1 meg RAM
with Atari mouse
Atari SC1224 - $100
Screen bows at top and bottom. This is
apparently due to a burned out capacitor.
Should be an easy fix.
Atari SM124 - $100
Still in perfect condition.
VideoKey - $50
Use a TV or VCR with your ST.
Works great!
IMG Scanner - $20
Scanner connects to print head of
dot matrix printers.

Software -
Laser C compiler. . . . $50| or both for
Laser C Debugger package. . . $25| $65
GST C Compiler $15
Personal Pascal $15
Quantum Paint $10
BBS Express! ST $30
Copy II ST $10
Universal Military Simulator . . $15
Falcon $20
Bloodwych $20
Dungeon Master . . . . $20| or both for
Dungeon Master II: Chaos Strikes Back . $20| $30
Chrono Quest $20
Carrier Command $20
Gone Fishin' $10

I also have many disks with public domain and shareware files, and quite a
disks from magazines such as STart. These would go with the computer if sold.

Again, all of this could be had for $500. I will pay shipping on any of this
assuming it is pre-paid. I will ship c.o.d. if desired, but I ask that the
buyer pays for that.

>time I'm in Europe. :-)

I have a copy of your game here... I ran it once, and can say that
it's quite good. As i'm not a game player, I haven't registered it,
and don't use it. I have still got a copy, and always will, the
reason for this is that if anyone ever asks me if i've heard of
it, i'll give it to them.

As for registering in General, Sadly I must say I haven't ever done it.
There is some software I intend to register, Hermes UUCP software
is on the top of the list if I can ever get it going !
Paying a foreign currency is a pain, it adds about $10 to the price,
if only more shareware authors accecpted credit cards (that only
adds $0.05 to the price), and made themselves available on major
networks.,... then users could just email them their credit card
number, and the author would be available to help users.

A reply from Charles F. Johnson...

Date: 04-Jun-92 17:55 EDT
From: Charles F. Johnson [76004,2232]
Reply to: FONT GDOS

On second thought, Bob -- here are some responses to the points made by Mr. Reschke. If you'd upload these comments, I would appreciate it.

=-=-=-=-=-=-=-=-=-=-=-=

>> This really shows one thing: WARP9 uses undocumented system
>> structures. Use another screen speeder (like NVDI) instead.

Sorry, it's not as black and white as you picture it. The pointer to the current workstation attributes is documented in Atari's SALAD document. The structures themselves are not documented, but the pointer IS, and developers have typically needed to fill in many of the blanks in Atari's documentation. The use of these structures is one reason why Warp 9 beats NVDI in all real-world speed tests -- i.e., tests of scrolling, dialog box drawing, etc.

In response to my point that G+PLUS allows the loading of new font sets without rebooting, Mr. Reschke states:

>> But only if no program has loaded them at that moment (like an
>> accessory that does load fonts).

According to Atari, desk accessories are _strongly_ discouraged from using Malloc() -- and vst_load_fonts() calls Malloc() for every font it loads. This is a strange response from someone who was, in the sentence before, crying about how Warp 9 uses undocumented techniques. Desk accessories should not call vst_load_fonts().

In response to my point that G+PLUS is faster than FONTGDOS, Mr. Reschke states:

>> This is only true for VDI functions with large trap dispatcher
>> overhead.

Wrong. When an application is using evnt_multi() there are _tons_ of VDI calls coming through the system _constantly_. Any program that introduces additional overhead into the trap #2 handler has a drastic effect on _overall_ system speed. G+PLUS minimizes this effect; FONTGDOS does not, and the difference is quite noticeable.

In response to my point that no program on the market uses the new bezier curve call, Mr. Reschke states:

>> Wrong. SciGraph uses it.

OK, I stand corrected. One program uses it.

In response to my point that many programs will not work properly with the caching mechanism of FONTGDOS, Mr. Reschke states:

>> Wrong. All programs that use vst_load_fonts() benefit from this
>> change.

You're the one who is wrong. There are several programs that use GDOS and have implemented their own caching techniques; Calligrapher is one, Timeworks Desktop Publisher is another. The method used in FONTGDOS conflicts badly with these programs.

In response to my point that current G+PLUS owners should stick with it instead of switching to FONTGDOS, Mr. Reschke states:

>> Let the customers decide :-) Don't forget that you have to _pay_ for
>> G+PLUS.

I would hope that current G+PLUS owners HAVE already paid for the program.

Ed Krimen writes:

>I'm fairly certain that Ron Kovacs of Z-Net cleared up the confusion on
>GEnie. The answer is that AEO #3 and the FONTGDOS archive contained within
>it can definitely be distributed and posted on BBSs.

From following the discussion between CompuServe and Ron Kovacs,
the ONLY way AEO #3 can be posted anywhere other than GEnie is
for someone to download it.. (and where is it ONLY available..?)
then unARC it and REMOVE the FontGDOS files that are covered
under the exclusive arrangement between ST Format magazine and
Bob Brodie "of GEnie", then reARC the remaining part of the files
and ONLY THEN can AEO issue #3 be uploaded anywhere else...

Wonderful treatment by Atari Corp for the non-Genie using portion of
their userbase, eh..? (NO distribution on Atari.Archive either)

Incidentally.. I'm now informed that the "offending" GEnie-only files
are no longer available on Bob Brodie's personal Z*Net BBS.

In article (THE MALPRACTICIONER) writes:
>I currently use viewgif to convert gif pictures into spectrum format.
>Viewgif also gives excellent results using dithered grey scales,
>bringing out much more detail than any colour representations I have
>been able to obtain.

Among the GIF to Spectrum converters out there the best one I have
come across is DMJGIF 3.0. Viewgif comes in maybe second.
DMJGIF provides 4 color dither options and one grayscale, and will
automagically choose what it deems the best dither option (you can
change it if you like). It will save it in .TNY or Degas or Neo
format if # colors permit and saves in SPC not SPU format (saving
space). It gives total control over scaling (magnifying and
shrinking) and uses the best scaling method (color averaging) of all
the PD/Shareware converters. It also allows fragments or pieces of
GIFs to be converted.
Another neat thing is that it allows the entire STE palette to be
used in a Spectrum conversion and DMJGIF comes with a program that
will simulate most of the STE colors (3375 of them) in a Spectrum
picture on a standard ST. It comes with conversion utilities to
convert SPU to SPC, SPC to PI1, and SPC to PI3.
Oh, and it does batch conversions. What a wonderful thing to be
able to walk away while your computer does a number of GIF to SPC
conversions. I'm sure there are more features that I've missed. For
a $15 shareware fee the author will send you a version that is twice
as fast, and he plans to upgrade the program to include Amiga .IFF and
Prism Paint formats conversions amongst other things.
This program by far beats BGIF, GIFSPC, and ViewGIF for GIF to
Spectrum conversions. The conversions are the best of any PD program
that I have seen. And I do Megabytes of GIF conversions.

It's on Atari.Archive at: atari/graphics/dmjgif3.lzh

Support your Shareware authors.

While it might be true that there are some benchmarks in which NVDI is
slower (I don't think so, but I don't have the benchmarks here), this
is definitively not the reason. Warp 9 patches the current VDI, this is
why it has to fiddle around with undocumented variables. NVDI replaces
the ROM VDI completely and thus can organize it's internal variables
exactly as it wants to.

Note that I have no connection to the NVDI developers, indeed I normally
don't use it because I don't need it on my machine.

In fact. They documented that last year, when there already were a lot
of programs doing that.

There are other situations where the problem can arise:

(1) Using a shell program that _does_ load fonts (like Gemini). A *LOT* of
people use Gemini over here.
(2) Using a multitasking GEM like MultiGEM II, Mag!X or MultiTOS.

OK, I didn't intend to make FontGDOS better than it is. It's really too
slow (AMCGDOS is much faster, but I bet you know this :-).

If a program uses vst_load_fonts() and 'own caching techniques' it's
obviously doing undocumted things. If a program merely calls vst_load_fonts()
and uses the documented VDI calls to access these fonts, it _does_ benefit
from FontGDOS improvements.

> In response to my point that current G+PLUS owners should stick with it

Of course. I sure hope that everybody has paid for commercial software
(including shareware) (s)he's using.

In article Steven.Wells@bbs.actrix.gen.nz writes:
>
>.SPS stands for 'Spectrum Smooshed' files.

Unfortunately, there are two file types with the .SPS extension, both Spectrum related. One is Spectrum Smooshsed as already mentioned (viewable via SPSLIDEX). The other is 'Spectrum Sequence' which is an animation of Spectrum pictures created by Unispec. These animations can be viewed by Anispec.prg (available at atari.archive as anispec.lzh).
Luckily, the WhatIs program can distinguish between the two. The easy way to distinguish them is file size. 'Spectrum Sequences' tend to be rather large. I wish I had seen a good animation in this format though.

> [SPSLIDEX] can save A LOT of disk-space (up to 50%
> compression of the file size on .SPC pictures!!)

The savings that I get are closer to 5-10k per .SPC picture (usually closer to 5k). I've never hit 50% but it is still a signficant savings. The only problem I have with the .SPS format is that many programs don't recognize it, such as DSLIDE which can be used to display many picture formats with one program. This necessitates unsmooshing pictures (and then only to .SPU when using SPSLIDEX, unfortunately).
But I still keep all my Spectrum pics in .SPS format.

From: vince@sci.kun.nl
Message-ID: <1992Jun5.130725.1248@sci.kun.nl>
Source record: 221156

I guess it all depends on what you intend to get form your release. Money? I doubt it. Appreciation or even fame? Maybe. Look at Eric R. Smith for example, Mr. MiNT. As soon as I downloaded MiNT, I sent for my ST to be upgraded to 3 meg. Only for MiNT. And as soon as I have it back (There were some problems...) I will send the rest of my money (well, at least part of it) to him. And I think Eric has become a highly respected Atarian. Personally, I think MiNT would even be a good reason to buy an Atari in the first place. I don't know how much Eric has earned from Atari licensing MiNT for MultiTOS but I'm sure there must have been something in it for him. (Personally I'd be satisfied only to have thousands of Atarians see my name in the DESK-dialog...) And, as we're talking examples here, what about Donald E. Knuth, Mr. TeX? Hhe might be one of the most famous programmers out there today. And TeX is completely PD. (And it's not just A good typesetting program, it's THE BEST typesetting program. No doubt.)

Now, if it would be easier to pay (the difficulties of paying in foreign currencies have already been mentioned) and there wouldn't be a minimum amount (If you use a GIF-viewer only to view three pictures a year, you don't want to pay the full amount for it. If you play a game every day from 16:00 to 3:00, you might be willing to pay more for it) I'm sure SHAREWARE can work.

Just MHO, of cause.

Source record: 221154

Shareware? I don't like it -- there are so many good free programs
that it isn't necessary!

Plus the whole concept bothers me -- it tells you to distribute as
many copies to everyone as you can, and get them to pay -- I don't
want to be the advertising for people. And most of the shareware for the
atari I've seen is worthless anyway -- crashes and bugs and other
things. The name really bothers me too "share"ware -- it *isn't* share, it
is *pay*ware. Truth in advertising, folks!

There are plenty of great free games -- nethack, tetris...

And editors -- micro Emacs (for those of us without a
gigabyte to run GNU emacs) and mg are both better than any shareware
(or over the counter :)) editors I've ever seen.

So putting programs out as shareware doesn't seem a very lucrative
option to me. Not with the competition of free programs you're up
against!

Scott

Source record: 221155

zmathews@isis.cs.du.edu (zak mathews) writes:
: SLAYER - horizontal shoot'em up, smooth scrolling, lots of varied
: aliens and LOTS of action and power ups with 'almost'
: constant 17 fps.

Yawn. Seriously, I have tetris with all this action & more, and NetHack
for intellectual stimulation. :)

: GRIBBLYS NIGHTMARE - platform game come adventure (early stages so far),
: rasters, samples, 25 fps, smooth animation
: and foreground masking (walk behind objects).

One thing I hate about games in general is that people are so hung
up on the bells and whistles (samples, graphics) that the basic
underlying concept of the game is ignored. One reason tetris is so
captivating is that it is just a great concept.

: a) The software is crap (sorry.... not very good i mean)

Generally, this is true. I can't even count the times a shareware
program I was looking at has caused me to have to re-boot.

: b) It has not been circulated enough.

I doubt this is a factor. With FTP and the idiotic "advertise this
for me: upload it to BBSes, give it to your friends" types of
pleading on the software, and anonymous FTP should get it out.

: c) People are dishonest by not paying up (as if !)

Well, that's true -- if the software actually is worth anything. Most
of it I've seen *isn't*.

: d) People do not know how to go about paying in foreign currency.

I can't even *get* foreign currency in my town! None of the banks have
it.

Shareware, other than being a HUGE turn-off to me in general, is
the embodiment of the "more trouble than it's worth" phillosophy.
Especially when you can get such great free things as the
Sozobon C compiler, gulam, microEmacs....

: I want a little discussion on these subjects and would like to know your
: views,
: such as do you use any SHAREWARE software ?,

I think I have 2 or three shareware programs on my hard disk collecting
dust (or whatever programs collect), which I seldom if ever use. One is

a pretty bad GIF viewer -- nothing I'd pay for -- one is a "programmers editor" (NOT!!) I like to keep to remind me how great Emacs is.

:have you paid ??,

No, I haven't found anything I liked well enough to fork over money.

:what is the right price ?

Free.

: Also what kind of incentives should there be for paying, such as a pat
: on the back, a better version or an extra piece of software ?

Quality software that does its job well, without crashes, bugs, or disasters.

Scott

If I get it right we're talking about a mac-emulator-emulator here?
I can tell you I have seen a software mac-emulator called ALADIN which looked really impressive to me at the time -- but then again, I had never seen a real mac then. It wasn't 100% compatible and couldn't read those silly mac-disks, but it was nice playing around with it. I remember I saw pagemager running on it (does this deserve an "!" ?), MacDraw, MacProject and some more. I also remember it needed continuous disk-swapping to get an application running, couse it kept on asking for the system disk.
(And the irritating patronizing beep whenever I forgot a Mac doesn't allow you to eject your disks yourself made me quite mad...)

So you see, it IS possible.

>Does anybody know how to use the Kermit protocol and STalker 3.0 together?
>I have no problem using Kermit with Vanterm or anything else but STalker
>does not seem to allow it?

As Frank Lohse has pointed out, the way to invoke an "external" program using STalker 3 is to use the script call "run_program". I don't have the docs handy, but the syntax is something like:

```
exit_status = run_program("program", "params", TRUE/FALSE);
```

where the last parameter controls whether or not stdio should be redirected to the serial port for the program (ex. if you want to run a CLI program remotely the way the remote-mode mini-BBS script does).

One word of caution however: we've recently discovered that running another program from an ACC is risky. It seems to work reliably if you're currently at the desktop, but if you're in another program (say a word processor) and get STalker to launch a TOS/TTP program, you'll crash when the main program tries to exit back to the desktop. You're safe if STalker is a PRG, or if MiNT is running, or if NeoDesk is the current program (because STalker.ACC will ask Neo to run the program for it).

Of course, if your Kermit utility is a GEM program, then ignore all of this advice :-) Simply run STalker as an ACC, then fire up the Kermit utility when it's time to do the transfer. Depending on how the Kermit utility uses GEM, you'll probably have to "disable" STalker with Alt-K so that it doesn't try to read the serial port while Kermit is doing its thing.

BTW, I'd be interested in getting a pointer to some good shareware/whatever Kermit utility. If anyone knows of a good kermit.tos please point me to it; we'll include it on the distribution disk in the shareware folder if the author allows it.

I haven't used one *but* I just read in one of the online magazines (I think it was Atari Explorer On-line but can't remember for sure) that Atari said some Mega STEs have "escaped" with TOS 2.05 and the 1.44 MB drive. The Atari rep (Townsend maybe?) said that TOS 2.05 does NOT format the 1.44 MB disk in a manner compatible with IBM PCs. However, TOS 2.06 will do the job correctly. The summary is that anyone having a Mega STE with the high density drive that wants to interchange disks with an IBM PC compatible MUST have TOS 2.06.

If you don't care about PC compatibility, than apparently TOS 2.05 works fine with 1.44 MB drives on Ataris and is compatible with other Ataris.

I'm curious about a program called FB Patch that was written for the ST back in 1987. It was a patch editor fro the Yanmaha FB01 synthesizer. The release notes I have for V1.1 state that a V2.0 was to be forthcoming, with some enhancements that I would like to have. Does anyone know if V2.0 was ever released? Does anyone actually *have* it that cares to comment on whether it's worth registering to get it (assuming the author is still alive and still gives a &%$# about the program)?

From: steve@thelake.mn.org
Message-ID: <A1278351557@thelake.mn.org>
Source record: 221162

[In article <BpC4v2.2n3@solbourne.com>,
pcbdoc@solbourne.com (PCB Documentation - Steve Matson) writes ...]

> I have been out of the loop on Atari for awhile. Whats going on?

Pretty much the same thing that was going on four years ago.

Products are slow to arrive, or don't arrive at all, and they're
slowly becoming less competitive in terms of price/performance.
The basic STE is not a bad deal when compared with other machines
in its performance class, but the higher-end offerings are priced
relatively high.

> Whats the latest hardware offering?

TT030: 68030, 32mHz, little VME slot.
Mega STE: 68000, 16mHz, little VME slot.
STE: 68000, 8mHz, similar to ST but takes SIMMs.
STBook: notebook 68000, 8mHz.

Atari has shown a single-board 68030 computer with a reportedly low price
tag, and has shipped models to developers. A 68040 workstation is said to
be in the works.

> Are there any upgrades to the 520St that are worth anything?

Memory, 68K accelerators, and a couple of boards that let you run TOS
2.06 (many enhancements including a new Desktop).

> Does Atari have multi-tasking yet?

>From Atari or from third parties? There was third-party multitasking when
you bought your machine -- Micro RTX, OS/9, etc. Now there's also Minix,
MiNT (a free TOS extension) and -- if you have a TT -- Unix SVr4. Atari
has shown something called MultiTOS that combines MiNT with changes to GEM
to allow multiple GEM applications to multitask, but it has not been
released.

> What rev is GFA basic at? (I have 3.1)

Eeeeeeuuuuuww! :-)

> Does Atari still treat folks like sh*t?

Depends on what you expect and what you're looking for. Atari is still
slow to get new products into the market, doesn't advertise what it has,
doesn't have a good dealer network and doesn't keep the distribution
pipeline filled with product. Any developer of software or hardware for
the ST is in for a rough time because the market, particularly in North

America, is in a shambles.

But treat folks like sh*t? I've never been treated poorly. In my experience, Atari Corp. personnel have been courteous and helpful. They answer questions. But you *must* have a GEnie account to reach them; nobody at Atari Corp. is reading Usenet at the moment.

> Where is the Atari focus these days?

Mostly music. Publishing is a secondary focus. There are some impressive high-end publishing systems in the European market that are based on Atari hardware.

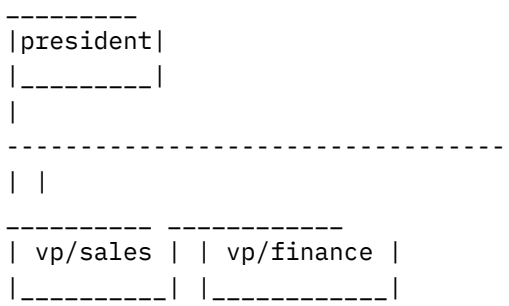
[In article <1992Jun5.012015.18179@ccu.umanitoba.ca>,
bright@ccu.umanitoba.ca (Bob Bright) writes ...]

> I think Calligrapher is being distributed in the U.S. by Codehead.
> The last issue of Atari Explorer Online mentioned that a demo was
> available on Genie, under the name of "CALDEMO.LZH". Does anyone have
> it, and if so, could you upload it to atari.archive for the benefit of
> those who don't have Genie access? Thanks,
> BBB

I have it, but I can't upload it to a.a. -- thelake.mn.org is not actually on the Internet. I could mail it to someone with Internet access, but it's 373K bytes before uuencoding, so if anybody on the net already has a copy, please put it on a.a. and speak up.

I found the demo frustrating. The key to the usefulness of the program is its ability to scale outline fonts for printing. The demo is crippled so that it can't save, but it also won't print and it doesn't even use outline fonts. It requires a proprietary version of GPlus+ that forced me to spend half an hour dinking around with my system software just to load the demo, only to find that I couldn't perform the tests that I wanted.

The most impressive feature of the demo is the outliner. An outline can be hot-linked to a document. The outline appears as a series of linked boxes containing brief text tags -- sort of like a corporate table of organization:



... et cetera. You can move the boxes around with the mouse and the associated sections of the document are rearranged. If you start with an outline before you create a document, the outliner can generate a more traditional text outline in your document window using any of several conventions.

Calligrapher lets you freely mix graphics and text in various fonts. It's not a publishing program or a drawing program, but it can create fairly complex documents if you use it in conjunction with other

tools. It does not appear to use the GEM clipboard. :-(

The demo version has a spelling checker that can be used interactively (it beeps if you type an unknown word) or to batch-check an entire document. The interactive use seemed to introduce a delay every time I reached the end of a word.

Scrolling is slow and feels clumsy. I wouldn't use Calligrapher for extensive writing and editing.

The expensive version of Calligrapher is said to have a grammar-checker and a thesaurus. I don't know how well they work; they were not present in the demo.

In article 2n3@solbourne.com, pcbdoc@solbourne.com (PCB Documentation - Steve Matson) writes:
> Whats the latest hardware offering?

Latest available is the 16MHz MegaSTe and of course, the 68030 TT. Rumors are flying and hopes are being held high for a low-cost 68030 called `Falcon' which is _supposed_ to be released late summer/early fall. We shall see, eh?

> Are there any upgrades to the 520St that are worth anything?

Yeh. It's called the 1040STe. Dump the 520 or give it to the kids and buy an STe with 4Mb RAM for around $400. Upgrading the 520 ain't worth it. Atari's new TOS (2.06) is a worthy upgrade, however.

> Does Atari have multi-tasking yet?

Officially, no. MiNt is available for download and MultiTOS (based on MiNt) is supposed to ship with the Falcon. Again, wait and see.

> What rev is GFA basic at? (I have 3.1)

Latest English version is 3.6 which included support for TT's but it was so buggy that GFA is no longer shipping it. We are all holding out for 3.7 which is to be the 'bug-free' (ha!) full-TT support version. No word on when 4.0 is coming. So the latest workable version is still 3.5e.

> Does Atari still treat folks like sh*t?

Dave Baggett addressed this comment quite elegantly already.

> Where is the Atari focus these days?

Same as usual, the $.

> Any other news thats note worthy?

No news, only rumors. And there are enough of those without my help.

And welcome back to the fold. Even with all Atari Corp's fumblings, it's nice to know the hardware can still be fun, eh?

If you seldom if ever use them, Scott, then why do you still have them?

>No, I haven't found anything I liked <shareware> well enough to fork over
>money.

And from your expressed attitude towards shareware in general, I doubt you ever will. Makes me wonder what _else_ is on your hard disk.

I don't understand this illogical aversion to shareware. If you don't like it, you don't pay for it. What could be fairer than that? Just because some folks feel the need to ask for a tiny amount of reimbursement for the time they spend coding and supporting their shareware offerings, is that a crime? Sure, there are lot's of good freeware offerings out there. But a lot of good shareware exists which is really bargain priced, IMHO.

What about Little Green File Selector? Pinhead? Arcshell? DCSHowit? Do you consider _these_ gems as trash, too? Few others would agree with you.

But like the man sez, "You pays yer money and you takes yer choice."

Tried to email you on this but the domain roma.uiuc.edu isn't known.
Where on atari.archive.umich.edu is TapeBIOS? I downloaded GTAR but
can't find the other package.

Emailed weiner but i think he has been turned into dev/null???

I have a TDC3660 which i would love to get working (ICD utilitys recognise
it on the scsi interface).

So if TapeBIOS hasn't made it to the atari.archive could you please post!!

regards
dennis

>vms zoo : V2.1 date: 91/07/09 02:10:34

VMS ZOO files must be in stream-LF mode in order to be read. Otherwise, you get the "corrupted" message.

Rahul Dhesi provided a program called BILF in order to convert from stream-LF to fixed-length 512-byte binary format and back. The ZOO program is released on the VAX with a copy of the BILF program (at least it is released that way on the VAX/VMS DECUS tape releases I have).

You need a copy of this program to successfully list/extract from a downloaded ZOO archive. It's worked nicely for me for the past several years...

5971. Re: SHAREWARE, discussion wanted

Newsgroup: comp.sys.atari.st
Date: 1992-06-05 16:31:12 UTC
From: vatec@sun.pcl.ac.uk
Message-ID: <1992Jun5.163112.9824@sun.pcl.ac.uk>
Source record: 221181

I would very much like to throw in my humble views here. Don't jump on me if you disagree, but by all means make a counter-argument. I think the best description of what shareware is, and its replated concepts can be found in the documentation file for 'llamatron' by that oh-most-zarjaz fella Jeff Minter. It really is people like him who keep the software scene alive.

I take the point about being a lot of free software about. No doubt that is a good thing, BUT I think that shareware can, if properly upheld by us, the users, fill a niche in the software strata, being of better quality than most freebies, and yet not charged at the exhorbitant prices extracted by many software houses. In the many, many pointless to-and-fro arguments about piracy, and wether or not it is turning developers away from the ST scene, nobody seems to consider shareware as a viable alternative.

Forgive me if I indirectly quote a few Jeff Minterisms here, but I think he gets the point across better than anyone else I ever saw, and imitation *is* the sincerest for of flattery. Like it or not, shareware is pirate-proof. BY *asking* that their software be copied, 'piracy' can do no more than improve the authors chance of reaching an appreciative audience. Basically, any amount of total junk can flood out in the name of shareware. Fine. If you don't like the software you use, don't pay the asking price for it. However, those pieces of software that prove popular willa ctually make the author money, not through any advertising or marketing, but on the strength of his talent alone.

This seem to me to be the best system. The money coming in is an incredible morale booster to the author, encouraging him, and others around him to make more contributions to the software libraries. Don't get me wrong, it's not an easy process, and survival of the fittest will be the rule, but sub-standard 'shareware' software will soon become scarcer, simply because the author won't get the positive feedback he would for decent code.

Also, shareware authors generally offer an upgraded version of their work to those who send in any money. This often is extended to regular upgrades. I appreciate that there are exceptions to every rule, eg Sozobon, but by and large, free software is 'as is' and often has no upgrade path to it. At least you have a channel of communication to a shareware author, and you can tell him what you would like to see done, either to existing software he has written, or in the way of new work.

Anyways. I think that shareware is the way forward. Take the money away from large software houses, and give it to the people who do what they do thorugh the love of it, and provide good software. Don't pay if you don't like it, but if you do, send the guy his money - he has worked long and hard on it, and you are reaping the benefit, so why not give a little back. Thats sharing.

Edd Deegan
vatec@uk.ac.pcl.sun

PS: I heard that Jeff Minter made 10,000 pounds out of llamatron ...

5975. Atari Explorer Online confusion

Newsgroup: comp.sys.atari.st
Date: 1992-06-05 17:51:24 UTC
From: ekrimen@wet.COM
Message-ID: <3982@wet.UUCP>
Source record: 221202

Yesterday I replied to a message about the AEO confusion. Well, it turns out I was wrong. :^) Only the AEO issue, AEO_9203.ASC, may be distributed. The FONTGDOS.LZH contained in the AEO_9203.LZH file may not be, unless you have permission.

The following is a message from Ron Kovacs from Z*Net and AEO.

Conf : Z*Net Echoes Conference
Msg# : 9533 Lines: 17 Read: 2
Sent : Jun 4, 1992 at 6:03 AM
To : Rick
From : Ron Kovacs at Z*Net News Service - NJ (Node #593)
Subj : AEO_9203.LZH

In reply to:

> Bob, I downloaded AEO_9203.LZH and as usual, I posted it on my board
> before even reading it myself. After unLZHing the file I read the docs
> for FONTGDOS and it states that the FONTGDOS files may not be uploaded t
> any BBS. Am I to take it that the entire AEO_9203.LZH package cannot be
> posted on my board? Do I need to extract just the AEO_9203.ASC file and
> LZH it for posting. I have removed the entire 9203 package from my BBS
> pending the final word from you.
> I am posting this msg here instead of Email so other SysOps will not b

You can post the issue but NOT THE file. You are correct about the documentation and need written permission tp post it on your system. To get the permission, you should contact Bill Rehbock at Atari Corporation.

Please unarc the file and place the issue out for download.

5976. 520ST working?

Newsgroup: comp.sys.atari.st
Date: 1992-06-05 18:03:09 UTC
From: mitch@giesy.mitch.b17a.ingr.com
Message-ID: <MITCH.92Jun5130309@giesy.mitch.b17a.ingr.com>
Source record: 221173

I have an Atari 520. I'd like to know if it is working. It is an early model, with no built in floppy drive. I hooked it up to a tv and got a white screen with a sparse scattering of multi-colored speckles. Should the thing have something in ROM, or do I need to get a floppy drive and an OS disk to bring up the GEOS-type of environment I seem to remember seeing on the ST when it first came out? I don't know much about this machine. Any help would be appreciated.

Thanks,
Mitch

I had a friend in Japan who sent me money (I loaned him the money for
the flight to Japan) in the states regularly. He just stuck an American
Express travelers check in an envelope and sent it via registered mail.
Does this not work well from the US to other countries?

The registered mail was a safety precaution, since travelers checks are
like cash, but is not totally necessary.

Well, I agree with you 100%. You can support this view by
not buying games which fit this description.

>Shareware, other than being a HUGE turn-off to me in general, is
>the embodiment of the "more trouble than it's worth" phillosophy.
>Especially when you can get such great free things as the
>Sozobon C compiler, gulam, microEmacs....

And how much support do you get when you find a bug in microEmacs?
Freeware implies a lack of commitment--that the author is willing to
let other people use his program but not to have to worry about
compatibility with new versions of TOS or bug fixes, etc. I would not
want to use such a "dead end" program. (For games and such I realize
that it is a different story.)

Me, I actually have registered some shareware and not just out of pity
for a struggling programmer. But it still feels good to register and
get a note of thanks from the author.

I am not sure if this post was getting out from my other
account, so here it goes again:

I am looking for DB Master One, it is a database program and
I believe it is PD. I downloaded once, but cannot seem to
find it, could someone please tell me where I could find it.

5989. odd problems...

Newsgroup: comp.sys.atari.st
Date: 1992-06-05 21:08:57 UTC
From: laird@think.com
Message-ID: <10ol59INNb6h@early-bird.think.com>
Source record: 221182

I'm having massive problems with my system. I hope someone here can help. Let me explain...

I started with a very old 520ST with 1 Mb RAM and TOS 1.1 (whatever the first ROM version was), running a BBS reliably for *years*. The serial port was a bit flaky (didn't do hardware handshaking properly, causing high-speed networking to hang periodically, despite testing the hardware and installing various bits of software).

I bought a used 1040STf, with TOS 1.4, hooked it up to the hard drive, modem, etc., and started things up. Everything appeared to work, but later files began to be corrupted. I tracked this down to my use of Atari's hard drive software version 3, and upgraded to verison 5 (the latest I could find). I also installed a TOS 1.4 patch, a new FOLDRXXX.PRG, and MACCELL from Atari, removing all of my old files in the AUTO folder except one that sets the system clock from the clock on my BMS 100 hard drive interface. No more files are being corrupted, at least that's the appearance. But now the system is having other odd problems. The corrupted directory structures are of course causing some trouble, and I haven't found a good tool to fix this. But more ominously, programs that used to run fine now claim to be running out of memory. Programs (including a promising-looking disk repair program) fail to find their resource files. Checking memory available using a DA tells me that my 1040ST, from the GEM desktop, has around 300K free. The BBS itself seems to run OK, but most "door" programs run out of memory.

Does anyone have any ideas as to what could be grabbing all the memory? Or what I could do to see if there's a physical problem with the RAM?

Right now I can choose between running a BBS that can't network, or running a BBS that can network but not run any door programs. Combining that with the directories *all* being corrupted is making me a very frustrated Sysop.

Message-ID: <1992Jun5.230816.22706@mits.mdata.fi>
Source record: 221184

I'd have a few questions about this game, since the manual isn't the modt accurate in the world :

1) The Pilot Controls card has the loading instructions. They say as follows for the Atari ST :

Switch on power to computer and disk drive, then insert disk 1 into drive A. If you have two disk drives, insert disk 1 into drive A and disk 2 into drive B. This program will then load automatically. Follow on screen instructions. For the Arcade Game insert the Disk into the disk drive abd turn on the computer, The Arcade game will then load automatically.

So, according to that, there would be two different game modes, one arcade and one that is not ? I have tried loading the game both ways, and have noticed no difference. So does anybody have an idea about what that is supposed to mean?

2) What is the Entry Code good for? (The one that is entered at the same time as the name and the callsign) I have completed two missions and have got no entry codes so that I could return to that mission later (the manual doesn't say anything about the entrycode).

3) How do I use the tractorbeam? The manual talks about it, and in several mission descriptions there reads that a tractor beam is fitted to the starcraft, but they left out the instructions how to use it.

Thanx in advance to all potential answerers!!

>
>This seem to me to be the best system. The money coming in is an incredible
>morale booster to the author, encouraging him, and others around him to make
>more contributions to the software libraries.

I don't mean this to sound obnoxious, but that bit about "the money coming in is a big morale booster" made me laugh out loud. Here is the fallacy: "If a program is popular, it will actually make the author money." This is, in fact, false, which is why I think shareware doesn't work. I'll give you an example that I'm personally familiar with: about a year ago, I posted "Unnkulian Unventure" to the net on behalf of D. A. Leary, the author. Soon after, I was flooded with email asking for hints, saying the game was just wonderful, etc. Leary got a fairly small number of registrations (although the registration instructions were prominently featured in the program and docs, and were mind-numbingly simple); after about 6 months he had around 20.

I didn't really know how to put this into perspective until I found an Internet FTP site that measured the number of downloads for various archived programs. Unnkulian had 1500, far more than any similar game. Just from that one site alone. And using Archie, I found that Unnkulian had made its way to over 50 archives on the net. (Those were just the ones that happened to be listed in the Archie database, too!) Not only that, but the game generated quite a bit of traffic in rec.games.misc and other groups. So I don't think the common argument that "it sucks" applies here at all.

The upshot: It's luck, and a lot of it. I don't know why so many people register Llamatron, but suffice it to say that we don't have simple "survival of the fittest" here. Jeff Minter's experience was very, very lucky. (One thing I do know about Llamatron: it got on the cover of several British ST magazines. I expect that made a huge difference.)

And what's the real result of this situation? It's not "the good software weeds out the bad," but instead, "the good software becomes commercial." There probably aren't going to be any more shareware Unnkulian games. Who are the real losers? The users: they'll now have to pay 2, 3, or 5 times as much for the same software.

Don't get me wrong: It's not that I think the user base is rotten for not paying up. In fact I think that the shareware concept in general is idealistic and impractical. In a society where everyone works for the good of the community, shareware would probably work well. But in the current climate it's a lot less effective.

5993. Re: IBM Keyboard on a ST

Newsgroup: comp.sys.atari.st
Date: 1992-06-05 23:14:08 UTC
From: kawakami@ocf.berkeley.edu
Message-ID: <44387@ucbvax.BERKELEY.EDU>
Source record: 221185

This is a response to BobR's anti-deka post:

I got a DEKA and right now, it works pretty well with the Keytronic keyboard I got for $55+tax. I really like the feel of the keyboard and I can type about 45wpm on it. I was typing around 35wpm with the regular ST keyboard, and I can get past 50wpm on the regular Mac Plus keyboard (but I poop out faster...)

The Deka was $89+PH, and out of the box it did not work right. Keys would get "stuck" because the computer never got the message that I let the key up. The mouse would click randomly. Omnimon sent me a bulletin with instructions on the fix: it involves soldering some resistors onto the ICs.\
\
Overall, I'm pretty happy with the setup, but the hassles I went thru to get it fixed are, in my mind, unreasonable.

Any other notes on the Deka?

5994. Re: 1.44 M Floppy on Mega STe

Newsgroup: comp.sys.atari.st
Date: 1992-06-05 23:49:13 UTC
From: Terry_C._Wells.ES_AE@XEROX.COM
Message-ID: <".5-Jun-92.16:49:13.PDT".*.Terry_C._Wells.ES_AE@Xerox.com>
Source record: 221187

I couldn't manage to decode a working e-mail address from your original note, so I'm sending this to the whole distribution.

Well, those stories are close, but not quite right. Double Density (DD) floppies formatted at 720K on a High Density (1.44M) floppy drive have no compatiblity problems whatsoever with real DD (720K) drives.

Where the problem apprears is if you try to use HD floppies in a DD drive, even if it's formatted in 720K mode. The media of a HD floppy is not quite the same as a DD floppy and the DD drive can't deal with it. I've tried it before, and I couldn't even get a HD floppy to format on my DD drive, let alone read data off a preformatted disk.

The secret lies within the HD drive mechanism itself. If the drive senses the extra hole punched in the case of a HD floppy, it uses a different head bias (or something like that) to be compatible with the different media type. When I replaced my stock Atari DD drive with a HD capable drive mech, I could format, read, and write HD floppies just fine in 720K mode (my controller only supported DD). Once I replaced my controller with a HD chip, I could then format, read, and write in HD mode.

A bit of warning. I don't know if you'll have a problem, since you're looking at an STe (probably >= TOS 2.06), but when I first installed my HD floppy drive, I was running TOS 1.2. I found that I had problems reading the second half of a HD floppy that was written by an MS-DOS PC. While 1.44M floppies formatted on the ST worked just fine, the ST couldn't read the 1.44M MS-DOS FAT correctly. When I upgraded to TOS 1.4, the problem went away.

I have the opportunity to get the above printer for a very low price,
and was wondering:

Does the 'NEC LC-800 Laser Printer' operate okay on an Atari 1040STFM
with TOS 1.2 (Soon to upgrade to TOS 1.4)

What emulations does it have (Epson, Pro-Printer.....)

Does it use the Hard-Drive, or standard Printer Port??

If anyone could tell me this information ASAP, I'd be most grateful.....

5996. Is the Atari Hard Disk Software that bad?

Newsgroup: comp.sys.atari.st
Date: 1992-06-06 03:20:58 UTC
From: rdo@kynes.bison.mb.ca
Message-ID: <H.E7T3Kj8YbY2@kynes.bison.mb.ca>
Source record: 221191

I've been comparing the performance of a 1040STe with a MegaSTe and discovered some interesting results.

I ran the gcc compiler (v2.1) with the optimize option on a sufficiently complex C source (i.e. gcc -O -c something.c). Both computers took the same length of time to complete the compile (2 mins 6 secs). I double checked the Mega and it was running at 16Mhz with cache. Hmmmm.....I thought the Mega would be about twice as fast. So what gives?????

The big difference I noticed was the time it took for the initial read of all the needed files from the hard disk.

1040STe: 6 secs
MegaSTe: 1 min, 10 secs

Yes, the program compiled faster on the MegaSTe (about 56 secs compared to 2 mins). But, the terrible hard disk performance cancels out this gain.

The two hard disks are:
1040STe MegaSTe
HD Type: Quantum LPS 105 Pro Seagate ST157N
Size: 105Meg 50Meg
Seek Time: 22ms 34ms
Host Adapter: ICD Advantage Plus whatever Atari Uses for a built-in HD
HD Driver: ICD HD Driver AHDI

Am I correct in blaming this terrible hard disk performance on AHDI?

I tried formating the Mega's internal drive with ICD's formatter, but it says "Can't find ICD Host Adaptor" :-). If I put both hard disks on the Mega, I seem to remember reading somewhere that I could then format the internal hard disk with ICD's formatter. (If you have an ICD adaptor "somewhere" in your system, that's good enough). But both drives are SCSI ID 0 so I can't do this right now.

Any suggestions on ways to improve the Mega's hard disk performance?

There is a program called BOOTA50H.PRG that when run will boot the computer in 50 Hz. It is real useful for Eurodemos and some games. If you can't find it on the archive, mail me and I'll send it to you.

For one thing, if memory serves me, the Seagate only tranfers at
550 Mb/sec while the Quantum tranfers at over 1,000 Mb/sec. Also,
are you using a cache with both? The ICD has it as an "automatic" option
but with AHDI you have to use cachexxx.

The $10 I was talking about it the banks fee on a Bank Draft (sp?).. that's
a cheque made out in the currency of the country it's going to.
With a Travelers cheque, you still have the fees to pay.

The other thing is you take the risk that the author is still at the same
address as when he/she wrote the software.
With a credit card transaction, I get charged a mere $0.05 in fees, the
author gets hit a bit harder than that, depending on what sort of volume
is going through.

As someone else here said, some games just have lots of flash colours &
sound, lots of hype, and no real game play.
I feel Llamatron falls in this catagory... especially with the HYPE!,
everyone talks about it being such a great game.
Unless i've played it wrong, all you seem to do is walk aroud the screen
with your fire permanently jammed on and shoot the things that are
on the screen, then it's onto the next screen. Boring if you ask me!

I think you picked the wrong example in pointing to MicroEMACS as a
``dead end'' program. The Daniel Lawrence version has been upgraded
many times, and bugs *are* fixed. Not only do you get the support of
the author, you get source code, so if you want to modify or repair
something, you can. In addition, you get the collective support of
everybody else who uses the program and fixes bugs. MicroEMACS has
been around longer than any shareware or commercial text editor
that's available for the ST, but longevity doesn't make it a ``dead
end'' program.

Sozobon C is another example. It was offered as a free compiler with
source code available to anybody who wanted a copy. As a result, it
has attracted a lot of bright people who have written C, GEM and
floating-point math libraries, a debugger, various utilities, and a
Desktop-friendly version (Heat and Serve C). A new version is coming
out in the next month or so.

If you have FTP capability, ftp atari.archive.umich.edu,
cd pub/atari/languages, set your file-transfer type to IMAGE
or BINARY, and get sozo133i.zoo.

If you don't have FTP capability, try the mail server. Send
a message to atari@atari.archive.umich.edu containing the
following line:

send languages/sozo133i.zoo

There are several other versions of the compiler at a.a., but 133i
(Heat and Serve) is the most reliable and easiest to install. The
archive includes the compiler, utilities, libraries, documentation
and a GEM-based auto-installation program. All you need to add is
a text editor and a couple of books on C (K&R recommended).

> is going through.
>
>
> Craig.

I think that Craig has highlighted upon the two major factors that
discourage shareware registrations from outside the country of origin of the
software, i.e. The overhead costs & 'Is the author still there?'

The costs of obtaining foreign currency is normally a very high
proportion of the registration fee, unless you're changing it in large
quantities or work for a bank, etc. Together with the knowledge that if
you send the author your local currency, he/she'll then have a problem
which'll mean that it may well cost them more to change the cash than
it's worth, it's a significant disincentive. [Luckily, I was working for

a bank when I needed some US$ cash to register things such as SuperBoot, for which I received the latest update]

The other problem that occurs is that with the way software travels around the net, libraries, etc, it may well be quite a few years old by the time it gets downloaded by someone. If they then want to register it, is the author still there. Again from personal experience, when you mail of your cash and hear nothing, you're left wondering, "Did the author get it?". After a couple of occurances it becomes annoying to think that you may well be wasting your money.

If this group ever gets an FAQ list, one section could be a list of shareware products/authors addresses and dates verified, which might go towards helping in some way with the latter problem.

Dave Baggett (dmb@wam.umd.edu):

I can offer one bit of incentive about BLOX. Personally, I think it <sounds>
like a very good game, and when I read your description of it, I decided that
I would download it as soon as I could...
Unfortunately, though, I have no access to ftp, and so I'm waiting for it to
appear on GEnie, DELPHI, or the like. As yet, I haven't seen it...
I think atari.archive might be a limited distribution medium for the ST
community, since there are few ST users who have access (as compared to, say,
UNIX users who have access). The only way a "normal" (usenet-impaired)
individual such as myself can get them is if someone volunteers their time to
d/l it from a.a and upload it to GEnie...

So would somebody please upload it to GEnie or DELPHI? Unless it's already
there. I could have missed it.

>may well be wasting your money.

Having said all this so far, I still intend to register some of my shareware as soon as I can afford it.
The way I plan to do it is to write to the author first, asking them to reply to me what there address will be in a months time by air-mail. This should take 4 weeks (2 to travel there, then 2 back for their reply). I will then send off the money, and they should send me back some sort of acknoledgement(sp? It's late!!), and I would receive that 4 weeks after sending the money.
That ends up being 8 weeks (2 months) to register something, + the expense of it all. At least i'll know the money is going to the right person, and i'll get a reply... if they don't reply, they don't get their money!

If I did all of the above by surface mail, it would be 8 months!

BTW: The other way some authors do it is to get a distributor in each country that collects the money and hands it on, tht would work better.

That is what FIDOdoor uses and it redraws screens very quickly (and works well under
mint/multitos).
>
>"MICRO"
>

Obviously if you use Bconout you lose redirection (although it doesn't matter
in this case).
Also note that using Cconws to print several characters at a time in the
hope of reducing the TRAP overhead is a bad idea because Cconws calls Bconout
though a TRAP call anyway.

Charles F. Johnson states his opinion:

> You're the one who is wrong. There are several programs that use GDOS and
>have implemented their own caching techniques; Calligrapher is one,
>Timeworks Desktop Publisher is another. The method used in FONTGDOS
>conflicts badly with these programs.

Wrong. It's the other way round: Some of the actually used methods in Timeworks
and Calligrapher refuse to run with MultiTOS. Therefore, the programmers _are_
working on clean solutions.

Well, for the most part your description is correct. I think that the
appeal is in the playability of the game; controls are easy and response
is quick. So many games nowadays are alike (platform, all graphics
and a bitch to control, no playability) but Llamatron (as well as his
other stuff) reminds me of the days of yore when games were playable
and the action was in the playing, not the huge scale animation. As for
all the flash, well, I like it (don't know why,) it reminds me of
all the flash in stuff like Defender and Robotron and a few others- all
games of excellent playability. The object is always the same, true,
but things change quite a bit from screen to screen, so it doesn't get
too monotonous- always a new bad guy to ruin your day :-)

Um, am I missing something here? I finally upgraded to STalker 3 a
couple of weeks ago (nice work, Eric!; there's a problem with the
shifted F2 function key macro, though--is it fixed it yet?), and my
upgrade disk had a copy of GEM-Kermit in the "Extras" folder. I
haven't used it much, but it seems to work fine. Just run KERMIT.PRG,
invoke the STalker accessory, start up the kermit server on your host,
and "get" and "put" to your heart's content. All of the GEM-Kermit
menus are available while the STalker window is on screen, and you
don't even have to disable STalker with Alt-K.

(GEM-Kermit is by Berhard Nebel. It's been around for ages--ca.
1986--so if it wasn't on your STalker distribution disk, look for it
on a server nearest you.)

6021. Casio CZ-230S...

Newsgroup: comp.sys.atari.st
Date: 1992-06-06 19:01:12 UTC
From: jbunch@isis.cs.du.edu
Message-ID: <1992Jun6.190112.22209@mnemosyne.cs.du.edu>
Source record: 221210
Cross-posted to: comp.sys.atari.st,alt.emusic,rec.music.synth

I have recently come to have a Casio CZ-230S, and wouuld like to know how to download sounds to the 4 programable banks? I dont have any docs on the keyboard, and no docs for the program that is downloading the sounds. The program I am using to download the sounds is czphonix.arc from atari.archive. It doesn't seem to talk well to the CZ-230S though? Is there some way to put the keyboard into a program mode? Also I have been using the keyboard with mastertracks pro, and have a couple of problems. When I have mastertracks start playing the keyboard always starts the rythym stuff, and I dont want it to.. Any info would be appreciated..

Please send all replies as email, and I will summarize to the net if there is interest.

John

Sorry about the roma.uiuc.edu address. My rn is braindead, so I usually
edit my e-mail address by hand, as above.

Due to the overwhelming demand, I have uploaded tapebios.zoo to a.a.
Look for it when the archive managers get around to sorting it.

Oh, and by the way: in light of the recent discussions about incompatible
lzh files and unlzh programs, why don't people do the world a favor and
swear to NEVER USE THE LZH FORMAT AGAIN. Zoo is much nicer, anyway, and it
isn't plagued by these problems.

>Which ftp site is the latest version of LZH? I got a version lzh201i.lzh,
>
For those who care... Somebody recently uploaded LZH201M to my BBS,
and while bopping about here in the Atari groups I happened across
some messages from T. Quester himself so I emailed asking what was
the status of v2.01m; he replied that he did NOT release that version,
rather (as I understood it...) he released the source code with that
version # in place, and asking that anyone who were to be making any
changes to the software keep him informed. He stated that he had NOT
received any such info, and that 2.01m was NOT his work.

Somebody may have been tinkering with a sector editor, perhaps, looking
for "upload credits" maybe?

Well in an effort to prove I know even less <g>. What you may want to try is just using a standard font to type the headings/text, then use the SNAPIT.ACC <sp?> to save the text as an .IMG, now delete the text & import the .IMG, once it's in the doc you can resize & position the .IMG till you get the result you want.

>Thanks,
>Gerry
>ggreenbe@rodan.acs.syr.edu

Well, let me see... hmm...

Ah yes, the old ST Internals Book has the answer.

There is an XBIOS call that allows you to redefine the keyboard layout
it is called keytbl. (sets keyboard table location)

ex:

```
move.l #-1,-(sp) : -1 Leave capslock table alone!
move.l #shift,-(sp) : Pass address of new shifted table
move.l #unshift,-(sp) : Pass address of unshifted table
move.w #16,-(sp) : set keyboard table
trap #14 : Let's do it!
addi.l #13,sp : Clean up the user stack
```

shift: $xxxxxxxx : 32bit address of 128 byte shift keyboard table!
unshift: $xxxxxxxx : 32bit address of 128 byte unshift keyboard table!

If you read back the contents of user (A7) stack after this call, you can
read the address of the ROM vector table for keyboard layout. That is
making the calls with '-1' (true) passed as the three parameters.

The keyboard table works like this:

In the table, the data consists of the ASCII values that represent the keys
pressed. At least that is how I think it works. The table starts with '0',
then key one = the Esc key value (27)

This should be a good start for you.

A while back I wrote a Dvorak keyboard layout program for the ST using this
call...

Good Luck

6036. Freeze Dried Term and Supra 2400+ problems

Newsgroup: comp.sys.atari.st
Date: 1992-06-07 06:23:07 UTC
From: ehohnbau@Bonnie.ICS.UCI.EDU
Message-ID: <9206062322.aa11203@Bonnie.ics.uci.edu>
Source record: 221228

I can't get FZT to utilize the extra capabilities of my
Suprt 2400Plus modem. The only connection I've been able to get
to work is 2400 baud, no RTS/CTS, no XON/XOFF at all.
When I try anything faster than 2400 with any settings, I get
a connection but nothing but garbage.

Flash allows me to use flow control and simply set the speed to 9600
with no problem and the throughput is pretty nice on the 9600 V.42/bis
line.
However, I would like to use Y/Z modem and so I must eventually
bid farewell to Flash, but I can't get FZT to work well so this may
not be the replacement I'd hoped.

Any ideas would be appreciated.

>HD Driver: ICD HD Driver AHDI

>Am I correct in blaming this terrible hard disk performance on AHDI?

No, you are not. The Seagate drive is much slower than the Quantum.
Independent on the host adapter you use with the ST157N you get a transfer
rate of appr. 500 KByte/s and with the LPS about 1100 KByte/s (both on the
ST).

6038. TT memory...

Newsgroup: comp.sys.atari.st
Date: 1992-06-07 12:53:19 UTC
From: ucacmsu@ucl.ac.uk
Message-ID: <1992Jun07.125319.11956@bas-a.bcc.ac.uk>
Source record: 221232

Last night I took my TT apart to see exactly what the situation was with the RAM. Here are the results...

On the main circuit board, under the HD, are 16 256Kx1 RAM chips.. 2MB ST RAM These lie inbetween two connectors onto which ges the extra ST RAM board.. The memory on this is provided using DIL packages soldered onto the daughter board.

To the left-front of the main circuit board is another connecctor onto which the TT RAM board is fitted. The TT RAM board itself has a large square format chip (c) Atari 1988 and four ex-SIMMs, I say ex-SIMMMs because they have been soldered onto the main board.. the board itself has all the holes AND diagrams for SIMM sockets, but these are not used! It would be trivial (once you've desoldered the SIMMs) to fit SIMM sockets on this board.

The SIMMs themselves have the word Atari on their backs.. suggesting that they may well not be standard, but they do look it.. they are the correct size and have the holes in the correct places.

On another note.. I can see why the TT costs so much.. It was definitley not designed with easy and quick construction in mind.

>Has anybody heard about this?

The SM147 is Atari's new monochrome monitor. I think the person you talked to at Atari was suggesting that you ask your dealer to see if he could arrange a swap plus cash of the SM124 for the SM147. If your dealer doesn't know anything about the SM147, you need to find another dealer. I suggest getting an ST magazine (which you should have already :^) and finding a mail order place. They should be able to help you.

BTW, what actually happened to your SM124? When it blew up, I hope you weren't injured!

Yes, this is exactly what happens when you run B.T. on tos 1.4 or higher.
There are a couple freeware programs that let you run the picture disk
from a ramdisk. When I use this with tos 1.6, B.T. runs perfectly. With
tos 1.4 and higher though, you need 2 meg or more, because all the picture
disk and extra goodies will not fit in 1 meg with tos 1.4 or higher.
I can send you the programs or someone who wants to put this stuff on a.a,
this is becoming a FAQ.

That is what FIDOdoor uses and it redraws screens very quickly (and works well under
mint/multitos).

> Obviously if you use Bconout you lose redirection (although it doesn't matter
> in this case).
> Also note that using Cconws to print several characters at a time in the
> hope of reducing the TRAP overhead is a bad idea because Cconws calls Bconout
> though a TRAP call anyway.

Remember, the original poster was asking for the fastest way to output text
under MiNT. If MiNT is active, then a number of things change:

(1) Bconout is no longer the fastest way to send things to the screen;
Fwrite is, providing of course that you buffer the output (e.g. by
sending as much data as possible in each Fwrite).
(2) Cconws is faster than a series of Bconout calls. Cconws may or may not
eventually call Bconout if MiNT is active, but in any case the task
switching and general MiNT book-keeping overhead would definitely be
incurred only once for the whole Cconws call. (MiNT's Cconws is faster
than TOS's, by the way.)
(3) (Not directly related to the topic of speeding things up, but...
Bconout can be redirected by MiNT. I still recommend using Fwrite,
because it is faster under MiNT.)

From: ken@isgtec.com
Message-ID: <2659@isgtec.isgtec.com>
Source record: 221301

In article xxx zmathews@isis.cs.du.edu (zak mathews) writes:
> > From: Terry King <tak1@ukc.ac.uk>
>
> What are your views on SHAREWARE ?

There are several forms of shareware, and IMHO none of them work except one.
The only way you'll get people to register is to make the demo crippled.
Make sure it is broken, non-operable, etc. There are numerous ways to
achieve this - in serious applications, disable print and save, in games,
use timeouts, have only one level in a multi-level game, large missing
features, no music/sound, severe bugs, or several of the above. IMHO the
best is serious missing functionality/level data. Don't include the whole
game and then disable part of it, someone might crack the disabled part.

People are basically dishonest. If they can get something good for free,
and nobody will ever know that they have it, the temptation is too great.
People perceive this as being different than pirating commercial software
somehow. Probably because most shareware isn't as flashy or professionally
done. You have to tease them with a broken version, and MAKE them pay
money to get the real thing. Jeff Minter might get away with sending out
working demos, because he's a big-shot designer, but less well-known
programmers can't get away with it. The ST market is too small, but even
for a big market the crippleware approach will get more registrations.
The drawback, of course, is you have to do some mail-order, copying disks
and mailing stuff.

Are you using SERIALFX.PRG? If it's properly installed and you lock
the aux port flow control using the included CPX, you should be able
to use just about any program at 9600 without worrying about flow
control.

6045. Sony 5.25" SMO Drive For Sale

Newsgroup: comp.sys.atari.st
Date: 1992-06-07 20:32:53 UTC
From: covert@cactus.org
Message-ID: <1992Jun7.203253.21041@cactus.org>
Source record: 221242
Cross-posted to: comp.sys.atari.st,misc.forsale,misc.forsale.computers,comp.sys.mac.wanted

********** SONY OPTICAL DRIVE FOR SALE **********

1 - Sony SMO-501 650MB external magneto optical drive.
plus 1 removeable optical disk media.

$1100, includes shipping.

Interface: SCSI-1
Average Seek Time: 95ms
Short seek +-64 tracks: 22ms
Read Speed(K/sec): 680
Formatted capacity: 650 MB per disk 325MB per side, need to flip
disk to access full 650MB. Formats to 650MB @ 1K
bytes/sector or 594MB @ 512 bytes/sector.

Form factor: 5.25"

EXTRA!! EXTRA!!! EXTRA!!
I just installed the latest Sony SMO firmware, version 2.22,
in this drive. I also have the complete technical manuals from
Sony Corp for the SONY SMO 501 drive, and the Sony SCSI Controller
card. I will include these manuals FREE!!

A little history of this drive. I originally bought it in April
1991 to be used with my Atari Mega ST computer. The drive came
configured with an ICD Atari-to-SCSI Host adapter, terminated in two
DB-25P connectors on the back of the cabinet. The cabinet is a long
skinny shoebox style cabinet big enough to hold the Sony Optical
Drive, the Sony SCSI Controller board, and the ICD Atari ST Host Adapter
board. I used the drive on my Atari ST for about a year, mainly as a
Macintosh drive with the Atari Mac emulator Spectre GCR. It worked
flawlessly that way.

I was able to afford to buy a new Mac Quadra 700 this spring and wanted
to move the drive to the Mac. I bought a SCSI ribbon cable to connect
the Sony SCSI Controller card to my Quadra 700, but couldn't get the
drive to work on the Mac. After some effort, I gave up on it, and bought
another Sony SMO drive for my Quadra 700.

Once I got the new Sony SMO, I called Sony Corp in California to ask why
my older drive wouldn't work on my Quadra 700, while the newer drive works
fine. It turned out that the older drive had firmware release 2.06, so
I order two new sets of Sony SMO firmware, one for each of my Sony SMO
drives. The new firmware is version 2.22. Once I replaced the older firmware

in my original SMO drive I was able to use it on my Mac. Now I have two
SMO drives, and don't need the second. So, I want to sell my older
SMO drive for the $1100 I mentioned earlier.

So, this drive can be used 'as-is' on an ATari ST computer, or you can
use the SCSI ribbon cable to bypass the Atari interface and use it as a
true SCSI drive on any computer which supports a SCSI drive. I have used
the ICD formatter on the ATari ST to format/partition ST cartridges.
I have used the LaCie Silverlining 5.33 formatter to format/partition
cartridges on my Quadra 700.

For more information please send me email or call
at (512) 251-9892

6046. IDE adaptor

Newsgroup: comp.sys.atari.st
Date: 1992-06-07 20:40:56 UTC
From: sourada@iastate.edu
Message-ID: <sourada.707949656@vincent1.iastate.edu>
Source record: 221237

Does anyone make an IDE adaptor for the ST's? I think ICD makes
one for the Amigas... With the volume of PC's sold, IDE drives are
very cheap, and since they aren't as intellingent as SCSI, they're
usually cheaper than SCSI drives...

I was just thinking, I haven't seen the FAQ for this group in quite
a while. I looked at atari.archive, and the latest one there is June 91.
If there is no one currently maintaining it, (David Paschall-Zimbel was
the last, and I don't know if he's on the net anymore. Contact me if
you are!) I'll be glad to take over.

Please send me encouragement or discouragement about this.

6048. Assembly/"Hacking"

Newsgroup: comp.sys.atari.st
Date: 1992-06-07 20:54:22 UTC
From: lombardo@odin.unomaha.edu
Message-ID: <lombardo.707950462@odin>
Source record: 221239

Hello!

I am interested in assembly language coding and I have the DevPac ST development package. I have tried learning assembly language on the ST before, but I never quite got the hang of it.

I am mainly interested in coding games and demos, but digitized sound mod players would be really cool to code as well.

Also, if anyone could help me out with "hacking" some demos and games that I have, so I can try ripping the music, effects, and/or graphics out of the programs. I have tried disassembling even my own simple programs, but I can't figure it out!

Would you recommend I buy Clayton Walnums Assembly Language tutorial or is that more concerned with assembly language calls to the OS?

How hard is it to code drawing routines in assembly language? 3d vector graphics? Overscan? Also, how do they perform sine/cosine operations is assembly?

///_ Marc Lombardo ///_

Quick question, I'm hoping someone can point me in the right
direction. I'm using sozobon C with dlibs 1.2, and i can't figure out how to
read a character without hitting return. if someone could point me toward
some source code or give me a quick hint i would be most appreciative.
I think what I want to do has something to do with Bconin, but i don't
know how it works. Anyway, email is preferrable as I rarely read
news.
Thanks,
Tad Hunt

My SM124 also died an ugly death recently & I have replaced it with an SM147.

The SM147 is a Multisync Grey Scale monitor that is VASTLY *INFERIOR* to my old SM124.

It has no speaker so my ST is now silent.

It displays all sorts of interference.

It flickers.

It has warped horozontal lines.

STAY away from the SM147 & try to find a used SM124.

Jim Cruickshank.

I must truly appologize for not returning mail for the last two months. Much has happened since then. I have had a major hard disk failure, lost my UNIX account, started a marketing business, and relocated for the 12th time since 1988 (IBM stands for I've Been Moved, not International Business Machins). Anyway, I promised to update and correct the errors in my TeX Installation Guide. But, CS-TeX 4.0 seems to eliminate any need for the article. CS-TeX 4.0 is self installing and well documented. Only one person expressed interested in the article. Also I have lost all of my backups, thanks to my 1.5 year old son who used my backup disks as non-editble cookies. Only if there is a great interest in using the non-CS-TeX programs will I re-write the TeX installation guide. The only advatage I see to the non CS-TeX programs are that they might run well on a systems with two 720K floppy drives. Since I don't have that configuration, I am stuck as to writting an accurate guide for this configuration.

By the way, CS-TeX 4.0 comes with a greateditor called Xedit 1.70. This editor looks like it is very well suited to TeX. Since I barely know German (I would like to learn but I never have the time) I can't figure out some of the parts to Xedit. Does anyone know what ".FWD" files do?

>what did you call it?
>
>Thanks,
>Jason Heideloff
>heidelj@alleg.edu

I uploaded the Tigercub demo to atari.archive (TIGERCUB.ARC) under the
"new" directory. It was my understanding from a past article that all
uploads were to go to that directory. It is unreadable for getting a
directory of, but you can still d/l from it if you know the filename.
This MAY be so the moderators can check out the programs first before
comitting themselves to releasing a possible trojan horse program. I
will keep uploading files to that directory in the future unless some-
one tells me otherwise as I believe that was the correct procedure.

It should soon be appearing to the newitems (and the midi) directories
soon when it does show up.

>Hello, everybody
>I'm looking for info about the falcon proyect(I'm not sure if it's a proyect
>or a real thing), price, about architecture, etc.

STR had these Falcon specs from a German magazine. The Falcon
seems real because I heard Atari has several thousand of them
in the wings! Anyone heard this too? Heck, the Mega STE
has a great price right now!

It would be cool if it did have the ram cards mentioned in the
specs so software would be somewhat protected. Could multiTOS
have some type of software protection mechanism for disks too?
Then instead of buying software from a store, people could
download commercial software from online services and later buy
some type of soft key to allow the program to be fully funtional.
I would guess each Falcon would have to have a unique identity
provided in ROM or a dongle.

Atari Falcon '030

CPU: 68030 @ 16-33 MHz.
RAM: 1, 4 or 14 mb configurations operating in page mode.
ROM: 512 Kb internal, 128 Kb cartridge port.

Ram: Cards 512k - 5 mb

DSP: 56001 @ 32 MHz, 32 Kwords (96 Kb) of 0 wait state private RAM.
DSP: connector to allow for modem/fax/voice mail/direct to disk,
JPEG/MPEG codecs. External Box w/software-9600bps, (100.00
approx) FPU: Optional (68882)
Internal direct processor slot for 386SX emulation, or other processors.

Super VGA : 640x480 256 colors.
True color 16 bits mode : 320x200 or 640x480, 65536 colors
Accepts external video sync. (Gen Lock & Multi-Media)
15-bit overlay mode for video tiling and special effects.
Programmable overscan
262144 possible colors
Hardware assisted horizontal fine scrolling and BLITTER graphics
coprocessor.

Independant 10 channel 16-bit digital audio DMA record and playback
channels with up to 50 KHz sampling rate. Stereo 16 bit DMA audio output
through a Bitstream 1-bit DAC, 80 times oversampling.
Stereo 8 bit DMA audio input.
RASCAL and SDMA audio signal coprocessors.

SCSI 2 port with internal DMA
High speed LocalTalk compatible LAN port.

Connector for RVB ST or modulator.
2 RS 232C serial port.
Bi-directionnal CENTRONICS port
Cartridge port.
MIDI in and out.

Stereo microphone input.
Stereo audio output.
Two joysticks ports.
Two 15-pin enhanced digital/analog controller connectors.
Integrated Keyboard
1.44mb floppy disk.
Internal 40-80mb (IDE) hard drive.

Anticipated retail cost 700.00 - 900.00

Hoi, the gif viewer I mentioned, being able to display jpeg files is
GEMVIEW. I have version 1.1g (20 march 1992) which is able to do this,
though this feature isn't documented yet (that's the g in the version perhaps)
Problem is I know it was a german ftp site (some university) I downloaded
it from, but I don't know which. I got the site from some
list that is published regulary here.

I can really recommend the program.

6060. GDOS on a TT

6065. Re: SHAREWARE, discussion wanted

Newsgroup: comp.sys.atari.st
Date: 1992-06-08 10:57:29 UTC
From: D.M.Johnson@newcastle.ac.uk
Message-ID: <Bplx3u.6sw@newcastle.ac.uk>
Source record: 221313

I think the major reason, Llamatron made money was the extensive amount of adverts that he got due to him first getting on the ST Format disk, then ST Format stated all the way through, support shareware, pay Jeff Minter his fiver and others may follow suit. Jeff gets interviews in ST Format, ST User, Amiga Format, Amiga Computing (may be more) all saying pay up and support shareware, it might encourage cheaper games from the software houses.

This must be about 10,000 pounds worht of free adverts.

I have paid for three shareware programs, Freeze Dried Terminal, (I like it) Two reason for this, It came on the front of ST Format with tips on how to use it, second I could register in England, at the Internet BBS, very useful.

The other two programs are for CIX and save me money, so the 30 quid I spent in registering for this two has saved me at least 30 quid in phone bills (more likely 100 quid by now)

I agree that the idea of shareware is good but don't pin you hope of making a living on it. The truth is the abilty to pay. Some people may be considering paying but can't afford it,(registering for the above programs cleaned me out) after paying more important things like food, gas, electric and rent. I would register (and use) more programs if I had the money. But as the above three are the only one I use often I felt I had to pay.

DMJGIF3.0 is a very nice program, but I don't use it enough to (1 or 2 times a year) pay the shareware contribution, If I did (and I had a hard drive big enough for the pictures) I would more likely than not register

I haven't deleted it, so if a friend asks for it I can give it to him. (Passing on shareware)

Dave

AL> I bought Turbo C (ver 2.03 I think) from Gribnif last year. Now they
AL> are offering Pure C upgrade. What's the difference between Turbo C and
AL> Pure C?

Mainly, it is a overall better product. The source-code debugger now works on non-ST mono screens (TT, etc), as well as 68030, etc. processors. The help facilities have been improved (you can now make your own english help screens), and now the assembler supports the 68000, 010, 020, 030, and 040 chips as well as the 68881 and 68882.

AL> Are the documentations/manuals in English?

No, still in German. You do have the TurboC Bible from Sams right?

AL> $175 is quite a bit of money for an upgrade.

I agree, but for my use, I needed the 030 compatibility (SST).

I have a TEAC 1.44 drive on my Mega ST, which reads/writes and formats 720K disks without any problems. I have traded disks with several people, and have had no problems with reading OLD single-sided disks from an old 520ST. Simply, it works for me!

Here in New Zealand there are 2 new mono monitors, one SM145 ? and SM147, the first No. is a guess, but one comes with a speaker for the ST series and one with out, for the TT..

Are you trying to use the TT one on a ST..??

6072. Printer codes

Newsgroup: comp.sys.atari.st
Date: 1992-06-08 12:02:24 UTC
From: pate@ra.cs.man.ac.uk
Message-ID: <5002@m1.cs.man.ac.uk>
Source record: 221334
Cross-posted to: comp.periphs.printers,comp.sys.atari.st

I've recently purchased an Oki Microline 182 printer (9 pin). It's a pretty old printer I think, maybe 7 years old (is that old for a printer?). I'm using this printer on an Atari 520 STFM (TOS 1.0, I think).

Anyway, the manual explains all the dip switches and printer escape/control codes, e.g. bold, underlined, changing fonts (actually characters per inch). The problem is the printer codes given are completely wrong! If I use the printer codes shown, they dont work. Only the obvious ones like tab, form feed and vertical tab work (standard ASCII codes).

By trial and error I've found out the following printer codes:

ESC 45 1 Underline on
ESC 45 0 Underline off
ESC 58 Small font (Elite?)
ESC 83 0 Superscript on
ESC 84 1 Superscript off
ESC 83 1 Subscript on
ESC 84 1 Subscript off
14 Large font
15 Tiny font (condensed?)
18 Normal font (Pica?)

(ESC is ASCII code 27, 1b hex)

The dip switches simply select what language your printer uses (and paper length), use 7 or 8 bits, append line feed, and use/not use internal ROM for something or other (if I select using internal ROM, then I just get rubbish printed).

When I do a test printout (holding line feed down while switching on) then the printer says it's IBM compatable.

__Does anyone know what the REAL printer codes are for my printer??!!__

Thanx.

6073. Using Nintendo auto RF switcher with ST.

Newsgroup: comp.sys.atari.st
Date: 1992-06-08 15:01:28 UTC
From: ehobbs@nmt.edu
Message-ID: <1992Jun8.150128.6524@nmt.edu>
Source record: 221320

I wanted to hook up my STfm to a TV with a 75 ohm coax input. I went and bought one of those auto RF switchers that are used with Sega and Nintendo machines. After hooking it up, I found that the picture was horribly fuzzy. I tried 3 TVs and got various shades of crappy. Can I actually use one of these RF switches? Are the impedences correct? Or is my RF switcher messed up?

Comments?

>Unnkulian games. Who are the real losers? The users: they'll now have
>to pay 2, 3, or 5 times as much for the same software.

I just bought every ST title Sierra had on special earlier this year. The average price per game was $11.50 US. That included postage. This was direct from Sierra. If one can wait a while to get a commercial game, one will often get it for LESS than the asking price of shareware. Also you get the benefit of learning more about the game from other people who have played it to see if it is really worth purchasing. I don't spend much time gaming so I have a huge backlog of commercial games purchased for prices between $1.50 US to $15 US.
I've looked at some shareware games, but spent more time downloading them than I did attempting to play them and then drag them into the trash can. I feel that if any program is commercial quality, it should be commercial. It's better for the user since they not only have support from the publisher, but also from the store they purchased it at.
BTW, I did attempt to register one shareware game. My check returned with no forwarding address. I did the honest thing and deleted all copies of it. It's not always the user who makes the shareware concept impractical.

I guess I'm the one who's missing something Bob. I've only seen the 3.00 distribution disk, so I wasn't aware that Gribnif had thrown a Kermit program on to the more recent ones. Good for them!

The Shifted-F2 screwup is a problem in the 3.01 .RSC file. You can fix it yourself if you have a resource editor (set the template and text fields to match the other fkey text objects). It's fixed in 3.02, the patch for which should hopefully be posted this week. Dan started creating the patch on the weekend after we finally resolved the one outstanding problem (a communication problem between STalker and NeoDesk that only surfaced under TOS 2/3.06).

I know Dave Small reads this group sometimes, so here is a question:

I know non-disclosure agreement bar you from even mentioning the word 'Falcon,' but will Spectre continue to work on new atari TOS based machines?

If so, I will automatically buy one at any price <= $1000. Also, with those nice color modes, and the flexibility of the Mac OS, could a color quick draw be coded to work on the TT or new machines? Better yet, are there any reasons why it most certainly _cannot_ be done?

|> It looks like AJR is the way to go from things that I have read..
|>
|> Roger... sheppard_r@kosmos.wcc.govt.nz
|>
```

I disagree. I find that zoo compresses smaller and finishes faster than lzh. Also, zoo has no problems creating subdirectories. If you want a new folder on your drive, then make it before you type 'zoo.' There are no problems with floppies either. Suppose you want to unzoo to a new directory on a floppy from an archive on drive d in the folder downloads:

```
% cd d:\downloads
% ls
butthead.zoo
% mkdir a:\newfolder
% cd a:\newfolder
% zoo x d:\downloads\butthead.zoo
--chew chew chew---done (lzh is still thinking at this point)--
% ls
butthead.doc butthead.prg README
%
```

What could be simpler? If you aren't using a cli though...well, I pity you.

RF modulation sukcs in general. The more stuff you have in the cable
between your computer and your TV set the worse the picture will be. A
not-so-good switcher box adds so much of the resistance (ohms) to that
cable it practically eats half your signal (not an exact number, I'm no
engineer but you get the idea...) Another bad idea are the Y-connectors.

If possible, hook your TV with a CVBS-video or SCART-connector to your
Atari's video output (it gives straight video signal from one of the
monitor connector pins you know; I don't remember from which one - check
your manual.) You would also get better audio if you soldered a RCA
connector or like to the monitor sound pin (when I had an Atari I did
this, used direct video and audio signals and the quality was superb
<well, for a TV set, really sharp and crisp>!)

This is exactly how NOT to impress me with your program, and will cause me to erase the program archive without further consideration. Since I currently maintain the DOM libraries for our local user group, your work will also never be seen by other folks within the Twin Cities area.

The few shareware programs for which I've registered (it corresponds the number of shareware programs I also happen to use...) have been complete, working programs which have offered value for the money. They include ARCSHELL, Super Boot and the TX2 file viewing program.

>have redirection of extracted output, will not generate a folder on demand..!

LZH201L, and the -lh5- format, are also unsupported on my UNIX and VMS boxes, making it impossible to extract documentation for preview before spending the hours downloading the multi-megabytes of files I obtain via FTP each month.

ZOO 2.1, on the other hand, is fully supported on =all= machines to which I have access.

Now, if the creator of LZH201 would kindly provide C-compilable source code for the latest version of his program suitable for execution on any UNIX or VMS workstation, I might be more impressed.

Also ... contrary to your reading of the facts, there are any number of LHARC programs available, and the LZH201 generates archives incompatible with each and every one of them ...

FAST is not something that individuals can join AFAIK. It's members are all
software companies such as Bullfrog, Lotus, etc. It's mainly interested in
Business software & corprate theft and to this end they have been very
successful by entering premises of some quite major firms and then
fining/coming to a financial arrangement regarding the masses of copied
software. Normally this is stuff like departments buying a program and then
bunging it on a network or another PC, both of which are generally a no no.
They recently trooped into Robert Maxwell's Firm(s) and found something
like 60% of software in use was copies (this is from memory).
Fast have a seperate section who deal with piracy in the leisure sector
called ELSPA who offer cash rewards to anyone who reports people selling
pirate software. Again, they've been very successful eradicating the
many magazine adds for pirate software that used to be so prolific in the
UK.
For further info, ring them on 0628 660377 (FAST) and 0386 833501 (ELSPA).
Both are UK numbers.

Upon rereading, I didn't mean this to sound so much like a threat. :)

As a general rule of thumb, I erase archives which contain a non-useful demo which demands shareware fees. I am not adverse, however, to putting forth a shareware demo (labelled as such), which displays the full usefulness of the program, including the ability to save data and send output to a printer. At least one database program, with limited record capability, has fit this description in the past year.

Also, as a rule, user group members don't tend to pick up DOMs consisting of 'demoware' (with the exception of commercial software demos which they would like to see before they go buy the Real Thing). This means that I have to be particularly careful about what I obtain from on-line commercial services, as download time is expensive. If the description includes 'demo' and 'shareware' in the key or description fields, it tends to be ignored. If the description does NOT include those words in either the key or description fields, and it turns out to be 'demoware' ...

Just thought I should clarify a bit.

Agreed! There is nothing more annoying than crippled programs. How can you
evaluate it if you can't use it?

All this discussion about shareware has really made me second guess what I
should do with a programming aid I've put together. I planned to release it
as shareware (NOT crippled) but now I'm leaning towards freeware. The
discussion here certainly hasn't given me any reason to see even the odd
money order in the maixbox. Maybe I should call it shareware and hope it at
least pays for my two-fours of Coca Cola Classic! Wishful thinking!

> controller for the ST as well for $300. I'll give you Windows for < $100
> (providing you get in on the "jump the OS/2 ship" deal), but then your speed
> increases just went right out the door... not to mention your HD and memory
> space.

Wait a second... you're Joe Isuzu aren't you? Who else could post complete garbage and almost make sense?

First of all, who cares if a used ST costs $100 and a new soundblaster costs $200. The used ST can't do DMA sound. So why mention it? It's like saying that a new TV costs $200 but a used Walkman costs $40, so gee, I guess I should buy the Walkman even though what I wanted was a TV.

And what's this OS/2 crap? If you want Windows for < $100, you go to Egghead or buy mail order. Gee, like mail order is a totally alien concept to ST users. And a TOS 2.0 upgrade puts you out $139, and what's that going to give the average ST user that TOS 1.4 didn't? Cuter icons and keyboard shortcuts. No multitasking, no virtual memory, no scalable fonts. So stop whining about the cost of Windows.

"then you speed increses just went right out the door... not to mention your HD and memory space"? Well, maybe under OS/2. Under Windows, a DOS program runs at the same speed as without Windows. Of course, if you multitask you'll lose speed. So, duh, what a revelation. Unlike OS/2 which sucks up gobs of memory and disk space, Windows 3.1 can be installed in about 4 meg of disk space, almost half of which is scalable font files which you can delete if you don't want. Look at what FSMGDOS requires in terms of memory and hard disk space and it's similar. And I'm sure Multi-TOS isn't tiny either.

> No, the older STs are not "state of the art", but 7 years after their
> introduction, they're still comparable. In 1985, when the ST was introduced,
> most 7 year old designs were sitting in a closet collecting dust
> (my old TRS-80 model I comes to mind). MS/Dos clones are just catching on to
> "point and click" and contiguous memory addressing, and those machines are
> still over the $2000 mark.

Well, gee, in 1985, didn't that TRS-80 or Atari 800 cost under $500, and at the same time the ST cost about $2000? So why buy an ST in 1985 when the 48K Atari 800 is so much cheaper. And those ST machines are just so much more complicated to use. Atari BASIC is so much easier.

Anyway, get your facts right. 386 machines and flat model capabilities have been around since 1986. You can write 32-bit programs for DOS, Windows, OS/2, or Unix, and not have to worry about 4 meg RAM limits like on the ST. You make it sound like the 64K limit was broken just yesterday.

A typical, even a high end, 386 machine is well under $2000 nowadays. Even fully loaded 486/33 systems are maxing out at $2500, but that's with 8 meg of RAM, Super VGA, and 200 meg of hard disk. If you want a 486 system that's more along the lines of a Mega STE or TT system, then again you're looking at $1500, not $2000+, about the same price as the Mega STE system. Sure, you have to blow a couple hundred more for an ST emulator, but you'd spend the same amount for a PC emulator on the STE.

So about the only thing I agree with you on is that the ST is 1985 technology. Comparable? Hardly. Cheaper? Not. A pain in the butt to maintain? Yes. I'm sure everyone knows an ST user who tried to install a memory upgrade or 16 Mhz board or TOS upgrade or PC emulator and ended up either frying their ST or throwing the upgrade in the garbage.

Typically ATARI Corp...
First, they proudly announce a font system that every other OS
(Mac, Windows) has got already. Then they don't release it for
months. After that, they release a substitute of it that nobody really
needs. And then, only GEnies can download it.
Fortunately, it is rumoured that it doesn't work.
ATARI, you give me pain in the ass.

Well, no flame intended, but you are assuming everyone is as you- honest
enough to register a program because you use it and like it. Unfortunately
most people are not like you are, and will not register unless there is
an incentive. 'Crippled' demos (ie no save or print features) are a
form of self defense for the programmer- if the public release were
complete as such even _less_ people would be inclined to register. I
know download time is expensive, and not everything is available via ftp,
and I'm sure that not everyone has free access to ftp, but not letting
people have a look at something just because "it's a crippled shareware
demo" is a bit extreme. The programmer has to do *something* to get
people to register, and you shouldn't hold that against him/her just
because you are honest enough to register without incentive, because
with most people this just isn't the case. Fortunately most of the
demos you would exclude from your club disks will get around eventually,
as your user group members may be missing out on some good stuff
(this said realizing that there is some bad stuff, too.)

BTW, I am not currently a shareware programmer, and I have registered
several programs.

The switchboxes for the Nintendo are triggered on and off by a DC voltage.

I was fooling around with it once. Try couping the signal from the
ST with a .1 uF capacitor and put the 9V battery in across the RF
terminals of the input of the switchbox.

It should switch on.

```
-------)|-----o--------->
|
ST ----- RF Switchbox
input --- 9V input
|
--------------o--------->
```

The battery has to controlled by you power strip, etc....

Concerning the ST emulator for the Amiga, I was extremely disappointed. It is much like running a colour emulator on your ST, and I could only get one program to work out of a handful of disks. I think it was the mono Super Breakout (The emulator is a bit faster in mono mode). This was tested on a friends Amiga 2000something. Has anyone else had differnt results? BTW, it runs a german TOS/GEM.

This is off the subject, but, can I hook up a game unit, say a Sega Genesis, to
my SC1435? I would like the nice crispness! (I know... boooooo.... hissszz..)

Is there a way? I know of a friend who hooks up a VCR or a game unit to his
Commodore 1080 (?) and he gets awesome pictures!

I might be the different plugs, because the Commodore uses a standard video/
audio jack for the same.
Wheres the Atari uses a different type of hookup...

BUT IS THERE A WAY? ANY SUGGESTIONS? I know that the stereo (sound) can be
coming from a game unit/VCR can be hooked up to the SC1435, but what about the
video??????????????

THANKS IN ADVANCE!

email please!

6102. Stuff uploaded to Atari.Archive - Gemview,BardTaleFix, RogueFix...

Newsgroup: comp.sys.atari.st
Date: 1992-06-09 07:17:31 UTC
From: baffoni@aludra.usc.edu
Message-ID: <l38mobINNbsh@aludra.usc.edu>
Source record: 221343

Hi all,

After looking through several German archive sites, I have finally
found GemView 1.2L. This version definately supports JPG as well as many
Truecolor boards, and a whole lot of other features I either can't remember
(I only skimmed the changes file) or they were in German (ONLY the changes/
whats.new was in english - the main text was in German, unless I missed one).
Check it out - however, don't bother if you only have 512k (like me) because
even the 125x125 JPEG that is included with the files wouldn't load in either
monochrome, Low, or Med rez - ran out of memory. However, it _did_ load so
you should be fine with 1MB, and it worked with my TOS 1.0.
Anyway, you can get this (along with the fixes below) in the "new"
directory, the file is called "gview11l.lzh". Hopefully it will be posted
to the graphics directory soon.
Thanks to ken@isgtec.com (Ken Newman), I just uploaded two fix files:
"BT.LZH" and "ROGFIX.ARC". BT.LZH is either a fix for TOS or it loads the
Bard's Tale Picture disk into a Ram disk so that you can play it on TOS >1.4
(2.0> ?) and not have to deal with the darn disk - I know that when I was
heavy into BT, I went through 3 disks - literally. I had to have it replaced
at my local dealer twice - actually I brought a disk in each time and they
recopied it. Wish I'd had this back then (and more memory :).
Rogfix.ARC is a fix so that you can run the all-time clasic beat-em-up
kill-the-monsters dungeon game on _all_ TOSes (I assume Ken that you checked
this on 2.05> ? Hows it look on the TT?). Very cool - when I become rich
and buy a TT (ha!) at least I'll have that game to play.
I wonder, though, what the STe/TT only games are going to look like....

Anyway, have fun y'all!

-Mike

6103. Re: SHAREWARE, discussion wanted

D.M.Johnson@newcastle.ac.uk (Dave Johnson) writes:

>I think the major reason, Llamatron made money was the extensive amount of
>adverts that he got due to him first getting on the ST Format disk, then ST
>Format stated all the way through, support shareware, pay Jeff Minter his fiver
>and others may follow suit. Jeff gets interviews in ST Format, ST User, Amiga
>Format, Amiga Computing (may be more) all saying pay up and support shareware,
>it might encourage cheaper games from the software houses.

>This must be about 10,000 pounds worht of free adverts.

You shouldn't forget that Jeff Minter is a very successful game
programmer, who has probably sold several 100.000 games in his
career, and he would probably have made more money by making
his latest games commercial. And he gets interviews in many
magazines because he is one of the best-known game programmers,
if you ever had an 8-bit atari or commodore you will agree.

I hope that more game programmers will follow his example,
because most of today's games are crap, and not worth the
100+ DM they cost. With shareware programs, you can both
try the program, and they cost about 1/5th of commercial
programs. This way, you won't ever pay for something that
is not worth it's money.

I think this attitude of most programmers who have been
disappointed by the response to their shareware programs is
destructive for the concept. The advantage of commercial
products is that they can be found in computer shops, they
are reviewed in popular magazines, etc., whereas a shareware
game is much harder to find. Which 14-year old computer-game
buyer has access to BBS's or anonymous ftp? Why not try to
find another way to spread your shareware program? Of course,
there are PD libraries, but how many are there, and who
will look there if he wants a game? Jeff Minter was lucky
to have his game on some cover disks of magazines, even
distributed by disk-magazines.

With programs other than games, most of the time they have not
been sufficiently tested, most of the one-weekend projects
are released as shareware (at least in Germany), without
a decent manual, and sooner or later people just stop bothering
about them. Why even pay 5DM for a PD disk, if you know there's
nothing useful on them (most PD is even worse than shareware)?

Also, I think that most of the commercial programs are just being bought (or pirated, that is) because of some good reviews in popular magazines - this is the only way to find out what they are like. In game reviews, you get screenshots of the amiga version in reviews of the st version etc., and most of the time a game buyer is disappointed with what he bought after some time. Of course, 14-year old spotty Darren (see Jeff Minter's READ_ME.TXT) doesn't care because it was daddy's money anyway and at least he'll have shelf full of games to proudly show his friends...

I think that Shareware will become more important in the next few years, because commercial products are becoming much too expensive, and as a result they are being pirated. As the computers get better, there are more and better programs available, which most users want to own, but who can pay that much? I remember back in the early 80's, computers with much less 'power' were much more expensive than say, an STe, but programs were much cheaper! So if most programs are pirated anyway, why not at least give people the opportunity to try a program for free, and wait for them to pay something to you directly? Isn't it more satisfying if you really _know_ that some people liked your program, and cared to pay $5 or whatever? Of course you will be disappointed if there is no response at all, but this means you'll just have to try harder! I personally don't need the 433rd Pacman-variant, even if it has samples and animated ghosts, but that's my personal opinion, other people may like it. On the other hand, Jeff Minter's Llamatron reminds me of the times I had 8-bit Ataris, when games had poor graphics (I'm not saying that Minter's games have poor graphics, mind you!), no digi-music, they would fit in 48K RAM and one 87K disk but they were _playable_! I haven't seen a shoot 'em-up game on the ST that comes close to Dropzone on the XL for example! Or those Lucasfilm games, like Eidolon and Koronis Rift, or Alternate Reality! (the XL version of 'the City' was much better than the ST version!). Of course, back then you could buy the originals, and still you wouldn't regret it! *sigh*

Sorry for that waste of bandwidth, but I just wanted to tell you that in my opinion the shareware is the only _honest_ way of selling your program. If you sell it through a big company, which leaves you something like 2$ per sold game, and they advertise it as if it was the most brilliant game ever seen, and many people are disappointed when they buy it for $50, why do you expect customers to be honest to you? Next time, they will just pirate it, find it worth less than $50, and never buy the original. It's much easier to find a game worth $5 than $50, and the programmer himself makes at least as much money. And if you are disappointed by the fact that

noone registered your program, think about the many potential buyers who would have paid $50 for a game they would have been disappointed of, if it was commercial. So if you're honest enought to give people the opportunity to try the game out for free, they _might_ be honest enough to pay. Much better than knowing that you sold 1000 copies and 50 times as many have been pirated, IMHO.

Pheew! This is the longest posting I ever made, sorry if I wasted too much bandwidth, but I just felt I had to say these things...

M.Y.

6104. Re: GDOS on a TT

Newsgroup: comp.sys.atari.st

In article <1992Jun8.202128.14225@sfu.ca>, gfarrell@fraser.sfu.ca (Gordon James Farrell) says:
>
>Try running it under an ST resolution. The problem is that anything before
>FONTGDOS or FSMGDOS doesn't recognize the new resolutions (I'm speaking from
>experience, here :-)).
>
There is nothing wrong with older GDOS versions, but only with the
ASSIGN.SYS files used before the TT came out. ASSIGN.SYS contains
a screen driver entry for each screen resolution, and the TT happens
to have more of those than the TT.
To solve the problem, simply add the missing entries to ASSIGN.SYS.
Each entry consists of a line looking like
0xp screen.sys
followed by the font list for that driver. 'x' runs from 1 to the
number of resolutions, so for the TT entries with higher numbers
have to be added.

>I would like to have larger text in some areas of my documents, and the
>largest font isn't quite large enough. Anyone know if there are any
>fonts out there that are larger that will work with this word processor?
>I don't know very much about this sort of thing.

Additional fonts (including larger ones) are available from Compo;
there are also some PD fonts available (bit I don't know any
sources outside Germany).

Another option would be to convert Calamus fonts to the GEM font
format used by WriteON, using the program C-Font offered by Compo.
This would allow the creation of fonts of almost arbitrary size
(there is a limit, but that's far beyond normal needs).

Finally, since WriteON uses the same font format as GDOS, it is
possible inprinciple to use GDOS fonts. However, this normally
works only for laser printers, as for pin printers the standard
GDOS drivers use different resolutions than the standard
Write ON drivers. Besides, the screen resolutions of GDOS
(95dpi) and WriteON (90dpi horizontally, 108dpi vertically)
are slightly different, although for many purposes this
difference may safely be ignored.

6107. Misc Atari ST software for sale

Newsgroup: comp.sys.atari.st
Date: 1992-06-09 09:34:35 UTC
From: djs@jet.uk
Message-ID: <1992Jun9.093435.26923@jet.uk>
Source record: 221102
Cross-posted to: comp.sys.atari.st,misc.forsale.computers

I am selling the following Atari ST software which I no longer need. All
prices are in pounds Sterling, and I'll ship free in the UK.

Mark Williams C compiler V3. K&R C + shell, make, ls, grep etc
Kuma resource editor, good manuals etc. 35.00

Mark Williams CSD. Source level debugger for above compiler 20.00

Neocept WordUp! GDOS word processor, v1.5, + loads of extra fonts 25.00

HiSoft WordFlair I word processor + loads of extra fonts. This
word processor includes (limited) spreadsheet and database
facilities. 20.00

HyperPaint: Atari painting program for bit image graphics 6.00

HyperDraw: Atari vector graphics program for editing metafiles 6.00

Saved!: HiSoft utilities, including reset-proof RAM disk,
print spooler, undelete program, accessory for
formatting etc from any GEM program, etc 6.00

Lattice Assembler (V3 I think, can't remember exactly). Includes
full TOS and GEM bindings, and big manual. 10.00

> it!

You philistine!!!

Llamatron is a class game of a type that comercial software houses just don't pay any attention to any more.....the type that is playable and fast and addictive.

It reminds me of the days when arcade games were actually fun to play instead of just a lot of pretty sprites.

Do you realy mean this, this must be the Bigest Joke of all time, for one thing
I don't have a PC but a Atari that runs Gem, if I wanted a CLI type machine I
would have not brought a Atari..

No about the CLI for LZH201.

from the .ttp d:\downloads\butthead.lzh a:\newfolder\

I think that this beats ZOO thing by a mile..

By the way you have never ever Tested LZH201L as they use the same compaction
standards and end up the same size and speed, but LZH201L has the edge..

If you want real speed go for AJR..

I do hope you use a robot to do all this typing for you. -:) you must
wast a lot of time, are you trying to break a record or some thing..-:)..

>against!
>
>Scott

This is a very small minded view to take. Lot's of people put a great deal of
effort into their shareware efforts (myself included).
Programs such as OPUS2.2 are of a BETTER quality than much comercial software
(and in the case of Opus, I mean for the ST/TT or PC). You have either not been
paying attention (as well as registration fees) or you are ignorant as f*ck.

If you don't appreciate shareware, then p*ss off and frequent another computer
system, because you have an imensly bad attitude.

P.S. The reason that shareware isn't very lucrative is that worms like you don't
pay their registration fees.

P.P.S. I appologise for my language in this post. I have never sworn on the
net before, and hopefully will never feel the need to again.

|>People are basically dishonest. If they can get something good for free,
|>and nobody will ever know that they have it, the temptation is too great.

To do with dishonesty:
I have a demo version of TURBO ST. It times out after 15 minutes. However,
it resides on my hard disk because it's useable through a Chameleon. When
it times out, just unload and reload.
I admit this is dishonest, and these days I tend not to use it, as it is
flaky and I often use MGR instead. I also intend to get Quick ST 3 within
the next couple of weeks.

But it just goes to show that even crippleware is not foolproof.
If I was really determined, I could take Turbo ST apart and remove the
time out. But I won't, because as I said, it's flaky.

>|> > NEVER USE THE LZH FORMAT AGAIN.
>|>
>|> Please get your facts right, its ZOO 2.1 thats is buged not LZH201L,

>
>I disagree.

Didn't we just go through this same battle a few months ago? Or
is there a news leak that's reproducing old articles.

Both zoo, and the Questor LHarc have their devotees. Perhap
alt.religion computer would be a better forum for this recurring
discussion?
However, is -lh5- documented anywhere? Did Thomas make this
format up himself? If not, couldn't someone else write a nice
portable version in C? Granted it wouldn't run as fast on an St,
but at least those people who have to uncompress things on other
platforms could take them apart.

If nothing else, the mere fact that 90% of the lzh'd files I see
nowadays are compressed with -lz5- means people are going to have to
learn to get along with it, asn it's dubuious it will go away.

As an aside to Thomas Questor, in case he's reading this. If the
-lh5- algorythm is documented somewhere perhaps you could provide a
pointer, at least. If, on the other hand, it is a your own variation,
you might consider posting a psuedo-code explanation, so some enterprising
unix hacker could write a portable version in C. People who are forced to
use the program to access archives unpackable in any other way are
unlikely to be well disposed to paying a shareware fee.

Just my .03$ (I know I went over the limit)

: >questions (it is commercial product).
: >Somehow I can't believe it!
: >Sounds like this AMIGA-emulator, which is simply a joke-prog.
: >
: >Anyone who knows more about this ??
: >
:
: If I get it right we're talking about a mac-emulator-emulator here?
: I can tell you I have seen a software mac-emulator called ALADIN which
: looked really impressive to me at the time -- but then again, I had
: never seen a real mac then. It wasn't 100% compatible and couldn't
: read those silly mac-disks, but it was nice playing around with it. I
: remember I saw pagemager running on it (does this deserve an "!" ?),
: MacDraw, MacProject and some more. I also remember it needed
: continuous disk-swapping to get an application running, couse it kept
: on asking for the system disk.
: (And the irritating patronizing beep whenever I forgot a Mac doesn't
: allow you to eject your disks yourself made me quite mad...)
:
: So you see, it IS possible.

The Aladin in question was not a commercial product: as every other
MAC emulator it needed Mac Roms: so Aladin was sold with a cartridge
(just like Spectre 128) to put the 64k roms in it! The full-software
version was a hacker version with Mac roms on disk (no roms any more) !

Disk swapping was just due to the mac system: try to use a mac without
hard disk: swap, swap, swap, ... The Aladin was not able (at least
version prior to 3.0 (hacker version included)) to use the Atari
hard disk !

I think a software only version of Spectre 128 is not hard to do: the
only problem is that it is not legal (Mac Roms copyright).

Finally, to read original Mac disks (800k), hardware IS required, so
that a software only version of Spectre GCR is IMHO impossible !

>......I found that the
>picture was horribly fuzzy.

You'll never get great video out on the ST's rf modulator, as
the sync frequency is not close enough. There was a box from
the now defunct Practical Peripherals that improved the signal
somewhat, but even then, to get the best picture out of it, you
had to get a clock crystal from them that changed the ST's 8mhz
signal to 7.something which divided down to NTSC's 3.1whatever
frequency.

I don't know if the PAL frequency is closer to a
multiple of the ST's 8 mhz, but if it isn't, a clock chip change
might help even the built in rf modulator. Of course, it also slows
your machine down slightly.

>This is what I've been saying all alnong!

As a counter opinion to this, I had a 147 at home for a demo last
month, and I'd say if I had to buy a mono monitor now, and couldn't find
a larger multisync cheap enough, I'd buy a 147. The lack of sound
would be a pain if I didn't have a monitor master, but I didn't see
any on the problems described when I played with one I had hooked up here
for a night.
In fact Jim, if you seriously don't like your 147, and it's
not defective (have you had your dealer check it out?), as we're both
in the same city, you can e-mail me if your interested in trading your
147 for a working 124 with the screen expanded.

Message-ID: <RALPH.92Jun9155220@orion.laas.fr>
Source record: 221112

After numerous demands, I have just uploaded degas2ps.arc to
atari.archive. It was written by someone at irisa.irisa.fr and is
offered as is (source is included -- intended for megamax 2.0 (laser
C).). The only test that I've done is dump 1 degas pic to our
PostScript printer, and it worked. Of course, I would very much
appreciate being informed of improvements and/or bug corrections.

The original message sent to me was:

test it before posting because i am not sure this latest version is OK...
trouble i have seen, with previous versions are:
1- sometimes st is locked when you select a large portion of screen,
or when you go in the corners
2- if gdos is loaded, image is not displayed.

all in all, postscript is fine!
there are 2 versions, depending or rsc and compilation (french/english)
even a small help! but no doc.

Cheers,

One thing you gotta give Darek: whatever he's doing at the time, he believes in.

Couple remarks though, from an ST user who's getting kinda seriously into Windows these days: I wouldn't say the 640 K barrier was just broken yesterday, I wouldn't say it's been broken yet. There are better and better ways to dodge it, but all the PC software I use (except presumably for the Windows kernel) was shaped by it. Maybe the next generation of stuff will really break with the old limits. From a programming standpoint, when a pointer is a pointer is a pointer...., and when I don't have to worry about whether a data object might cross a segment boundary, the 640 K barrier will be forgotten. You're right: I'm VAX-centric (or IBM 7094 centric, if you remember those).

And as far as customizing a Windows installation goes, it sure helps to work for Microsoft. The manuals are now written in English, I'll give them that, but it remains excessively difficult to find anything out of the ordinary.

Sure, the ST is painfully slow in its basic operations. I really hope that's going to change. And 4MB looks just as restrictive as 640 K looked a couple of years ago. But the ST remains easy and pleasant to program, and GEM remains an easier system than Windows for non-technical users. It's really a shame Atari blew all their money on Federated, and is only just getting back into things: there are enough right decisions underlying the ST / TT line that I'd really like to see a new generation of personal machines from it. Maybe we'll be so lucky.

Steve

WHAT?
Llamatron BORING??

True, you need a certain hard-core addiction for this type of game but for
blast junkies like me it is the ultimate. I mean what's better than sitting
down and trashing a few thousand baddies? Llamatron is in fact rather good,
every screen is different (yes, they are) and boy, does it get hectic in
the higher levels! The joystick suffers, the mind goes bananas, colors flash,
samples scream, curses fly, what more can you want?
I guess you just have to be a little insane.

I love Llamatron. I play no other games. Jeff for president.

In article <1992Jun9.085334.10625@email.tuwien.ac.at> yannikos@vmars.tuwien.ac.at (Marinos Yannikos (Prak Alex)) writes:
> I think this attitude of most programmers who have been
>disappointed by the response to their shareware programs is
>destructive for the concept.

I don't really see your point. What would you have them change? Is your solution, as one poster has already said, that "all commercial quality programs should be commercial?" Personally, I barely have time to write the share/freeware games I write, much less spend days on the phone trying to sell them myself or to a European game company.

> Why not try to
>find another way to spread your shareware program?

OK, like what? It seems like you're placing the blame for the lack of shareware success on the authors; it's the "you don't promote your product enough" argument.

If I'd made HacMan II shareware instead of free I'd have better data to work with here. But I do know that the only place *I* ever uploaded that game to was atari.archive, and I suspect the game has made its way to at least 75% of the color ST's out there. (It was in the top 10 game dowloads on GEnie.) I really don't think distribution is a problem. Software that people like *will* get around -- you can be sure of that.

Some people seem to be trying to twist the shareware concept into some grand ultracapitalist scheme. By releasing shareware, I am *not* looking to make thousands of dollars. If I were interested primarily in the money I'd do the legwork to get things published by game companies in Europe. In fact I'm really only looking for some minimal compensation for my time.

I'm guessing that altogether HacMan II required about 3000 hours of work. (This comes from a figure of 3 months full time, spread out over about a year and a half.) You can trivialize the game all you want by saying it's just "yet another Pacman clone," but until you actually try to write a commercial-quality game on the ST by yourself you have no idea how amazingly tedious and time-consuming the nitty-gritty details can be. Blox took less time, but I decided to release it as shareware because I really can't justify the ~$60,000 opportunity cost of putting that much spare time into something free any more. I was hoping the shareware concept would work, but so far it really hasn't.

> I think that Shareware will become more important in the next
>few years, because commercial products are becoming much too
>expensive, and as a result they are being pirated. As the
>computers get better, there are more and better programs
>available, which most users want to own, but who can pay
>that much?

This is exactly my point. An attitude of "99% of shareware is crap, therefore I'm not paying for it" inevitably leads to an incredible lack of shareware and a predomenance of (expensive) commercial products. This is currently especially true of the games market: how many half-decent shareware games are there? Not many, and the reason is that it's just not worth it to work hard enough on a game to make it good and then not make any money on it.

> So if
>most programs are pirated anyway, why not at least give
>people the opportunity to try a program for free, and
>wait for them to pay something to you directly?

I'm almost reading this as: "You can't stop piracy, so you might as well give your stuff away free and hope some people take pity on you."

>Isn't it
>more satisfying if you really _know_ that some people
>liked your program, and cared to pay $5 or whatever?

Not really. Ego is *not* the only (or main) thing that motivates shareware authors. (At least not this one.) It's mostly that writing useful programs is fun, while playing salesman is a complete pain in the butt. The problem comes when shareware brings in *no* compensation. Nothing is free; if I spend 8 hours a night after I get home from my "real" job writing a shareware game, I'm losing money I could be making doing something else with that time. At the very least I'm losing valuable relaxation time which will eventually have to be squared with a longer-than-normal vacation. (I suppose you could always endure perpetual burnout, or spend a few weeks in the hosptial now and then...)

>Of course you will be disappointed if there is no response
>at all, but this means you'll just have to try harder!
>I personally don't need the 433rd Pacman-variant, even
>if it has samples and animated ghosts, but that's my
>personal opinion, other people may like it.

Since this is obviously a swipe at me personally, I can't resist retorting: Give me a break! You write even a trivial game for the ST and then tell me to try harder. Your attitude is almost enough to convince me to *never* write another piece of free software for the ST again. You're certainly entitled to your opinion with regard to HacMan II, but *don't* tell me to "try a little harder" and then I'll make money. This is an absolute insult; you might as well be telling me to wash your car for free a few more times and maybe then you'll be my

friend.

It doesn't work that way: people do stuff if it gets them tangible positive rewards, whether they be fortune, fame, friends, or whatever. The carrot-on-a-stick tactic doesn't work. You just can't say, "Now that you've poured three months of your life into this game, write something *good* and then maybe I'll give you a couple bucks so you can buy yourself a sandwich" and expect anyone to follow along for long.

>On the other
>hand, Jeff Minter's Llamatron reminds me of the times
>I had 8-bit Ataris, when games had poor graphics (I'm not
>saying that Minter's games have poor graphics, mind you!),
>no digi-music, they would fit in 48K RAM and one 87K disk
>but they were _playable_!

Again, give me a break. While I think Llamatron is very well-executed, let's face facts. You're choosing a ripoff of one game versus a ripoff of another. Both games are virtual clones of their arcade parents. (That's probably why neither of them is a commerical game, by the way.) Are you really making the claim that Llamatron is a better-executed clone of Robotron than HacMan II is of Pacman?

There's nothing wrong with liking Robotron more than Pacman. But don't extend that prejudice into an argument that says that Dave Baggett should try a little harder so he'll be up to par with Jeff Minter. That kind of argumentation is totally unproductive. This is not a "can you top this" contest between Jeff Minter and Dave Baggett.

> I just wanted to tell you
>that in my opinion the shareware is the only _honest_ way of
>selling your program.

Grrr.

>-- David Paschall-Zimbel

And I thank you David! I feel that crippled shareware is just annoying, and
useless. If the shareware program is fully functional, and the registered
version offers a few extra features, that would be more acceptable to me and
would probably motivate me to register a program I like (I haven't yet found
anything that meets both criteria :-). Also, offering additional software
upon registration is another motivating incentive.

Maybe the Shareware authors need to form a union! :-)

> impedences correct? Or is my RF switcher messed up?

I use a SEGA Master system RF modulator switch with my Atari ST (it's the standard one) , but unfortunatly it is not an autoswitch. However, I did try a Nintendo one and had the same problem. I'm afraid you're stuck going behind your tv every time you want to hook up your Atari to it.

This is not true at all. I use Flash constantly with zmodem upload/download
with no problems at all. What you need is the shareware XYZ ver.2.01 program
which can be "exec"'d from within Flash easily. I also have Flash 2 which
has builtin zmodem but I'm waiting for the maintenance upgrade because the
current version is very unstable. XYZ is very solid (as is the original
Flash 1.6).

I'm suprised the topic of 'licenceware' hasn't come up in this thread yet. There's a company in Britain - Budgie UK - that distributes their disks through PD libraries for 3 - 4 pounds (this is fixed irrespective of the library's prices for other PD) and passess on a small cut of that price to the authors.

True, you can copy it freely after this, so not evryone who has the game is obliged to pay for it, but it does guarrantee _some_ income to the author, and the scheme seems to be pretty successful (lots of titles and the great majority of libraries carry the Budgie range).

The games they produce are only OK, but I have no complaints at the price. I wonder if overseas authors could register with Budgie to overcome the currency problem too, or if there are similar schemes abroad that could enter into a reciprocal arrangement ?

Sam.

Don't forget that with the TOS 2.0 upgrade you get greater incompatability
with your software. Considering that much of the ST software is either
no longer supported or the company is out of business, that means you have
to fork out more $$$s to get something similar that will function under
TOS 2.0.

6138. Finally bought an Amiga...Sorry guys.

Newsgroup: comp.sys.atari.st
Date: 1992-06-09 18:14:00 UTC
From: cpw8034@zeus.tamu.edu
Message-ID: <9JUN199213141008@zeus.tamu.edu>
Source record: 221123

Well, I finally broke down and bought an Amiga despite my long history of owning Atari's (Atari VCS, Atari 800XL, Atari 520ST...). I bought a used base system from someone in Austin (only 3hr drive from here). Then, I bought their VGA-type video adaptor and hooked it up to an NEC multisync ($180 used). I'm pretty happy with it I guess.

Now supposedly, some company is coming out with a MacII emulator complete with 8-bit color graphics and all on the 3rd week of July with a 486 emulator on the way this Christmas! Sounds great but I'll believe it when I see it!

Anyway, I bought a slew of other stuff under Commodore's Educational Discount from a local dealer. All you have to be is either a student or an educator... Their prices are coming down and they're upgrading something or another too. But buying the computer used is still a way better deal.

So all in all, I'm still using my DeskJet, Modem, and of course my atari joysticks :)

Catching up on the latest news, where can I get a hold of this Atari ST Emulator on the Amiga? What about an Atari 8-bit emulator? (still gotta play M.U.L.E.!) Well, I'd appreciate any help on any of this stuff and BTW, I went down to the local rental place and rented Populous II for the Amiga and it's way overrated. Nice graphics and a slew of new divine interventions but S L O W as hell when you get a handful of people on the screen. Well 'nuff said c ya.

For future reference, there are 2080 work-hours in any given year, assuming that 'full time' is equivalent to working 40 hours per week. I wanted to point this out because (a) I've had the figure ground into my head while doing annual reports for my computer site and (b) people have a tendency to overguesstimate time spent on a project unless they keep adequate records.

David, if HacMan II *did* require 3000 hours of work over a year and a half time, I'd really like to see your daily schedule. It must be horrific!

I'll second that. Though it isn't an excuse for poor software,
writing even a trivial seeming well-thought out game can take
one hell of a long time. Go ahead, write Space Invaders or
Galaxian or Asteroids, and make it look Real Good with *smooth*
play. It ain't simple, which is of course why there aren't
a whole lot of quality shareware games out there.

Message-ID: <1992Jun09.182349.2187@bmerh2.bnr.ca>
Source record: 221126

Cheap synths that you might look for include:

1) Casio CZ101/1000/3000/5000

The 101 has mini-keys, but it can respond to 4 midi channels at once.
The 1000 has a full size keyboard but is otherwise the same as the 101.
The 3000 and 5000 were the equivalant of 2 1000s. The 5000 had a
sequencer built-in.

There was also a 'home version' of the 101 that had an amp and speaker
built-in. I think it was the CZ230S or something.

Main disadvantage: they don't respond to velocity. But they are
cheap, and sound good.

2) Sequential Circuits 6 Track/Multi-track/Max

Some multi-timbral synths from Sequential.

3) Roland D5/D10

4) Korg Poly 800/800 II/DW6000/DW8000

5) If you don't need a keyboard, or if you can get a hold of MIDI
keyboard controller (Yamaha KX5, Korg strap-on controller etc.)
you can use a MIDI tone-generator such as the Roland MT32, Korg EX800,
Yamaha FB01/TX81Z etc..

To find used equip. check classfieds, second-hand stores etc.. Several
mail order places are also there such as Daddy's Junky Music, Rogue Music,
Caruso Music etc.. If you want their addresses, email me and I'll send
them to you.

vatec@sun.pcl.ac.uk (Edward Deegan) writes:

This follow up isn't timely, but we can thank SCO Unix for that. I have
wanted to say something for a long time so I'll hang it here.

I doubt anyone here knows me (I tend to hang around OS-9oids, though I
have a couple STs too) but I have written quite a bit of stuff, from
compiler drivers to archivers to C libraries in asm for speed and space.
I gave it away. Perhaps because when I started it was the way you did this.
Perhaps because if felt good. But I do get respect and my name is known
there. I've seen the invention of shareware (or more properly begware)
and don't care much for it. It seems to be a cottage industry where
anyone who can type tries to make (or supplement) a living by selling
something that can be produced easily, with little experience, and at very
low cost. And it shows. Most of the stuff is either trivial or poor
quality. That may be a harsh judgement, but it is mine annd I am entitled.
In contrast, it seems like the stuff in c.s.m, c.s.u, or etc is good quality
and free (c-news, elm, rn, nn, elvis, stevie, sozobon, etc, etc, etc).
If what you have is good enough to sell, sell it. If you can't afford to
market it yourself, take it to someone who can. If it isn't good enough
to sell, then give it away. But don't tell me I am obligated to pay you
money for it since you made it shareware.

>I take the point about being a lot of free software about. No doubt that is a
>good thing, BUT I think that shareware can, if properly upheld by us, the
>users, fill a niche in the software strata, being of better quality than most
>freebies, and yet not charged at the exhorbitant prices extracted by many
>software houses.

Software doesn't *have* to cost a ton (i.e. Turbo Pascal, anything from
CodeHeads, etc). Mind you, a shareware author *is* in business whether
he wants to admit it or not. Is it really more expensive to sell the
software up front from your house (put a crippled demo up on the BBSes)
than to distribute crippled shareware?

>In the many, many pointless to-and-fro arguments about
>piracy, and wether or not it is turning developers away from the ST scene,
>nobody seems to consider shareware as a viable alternative.

Perhaps this is because it isn't really a solution. Pirates couldn't
afford to buy the stuff they steal. Therefore, while what they do is
illegal, immoral, disgusting, and filthy, they really don't reduce
sales of a product significantly.

Perhaps the most telling observation of shareware is that Jim Button has
gone commercial.

6144. are Epson LQ570 drivers available for 1040ST?

Use compress/decompress on unix. This creates .z files which are comparable to zoo in efficiency (not as efficient as lzh though...hadda say it:).

These utilities should be in the news binary directory since they are used to transport news feed batch files. There is a PD compress/decompress utility for the ST. I found mine on GEnie.

About the TAR problem, is the TAR on a disk? Tape? If you can transfer a TAR file over to an ST, there are TAR utilities for the ST. Otherwise just use the 'tar' command on the unix machine. Maybe I'm missing the intent of the question.

6146. Help needed on populous level

Source record: 221134

After playing Populous II for a while, I am stuck on a godawful level called 'UNNEAK'. All I have is the raise/lower land ability and the "place-holy-icon" ability. The good 'ol computer has the ability to create aphrodite heroes, which he promply launches at my land.

To make matters worse, once the holy man gets 'charmed' by an aphrodite, there is no way in this scenario to get rid of him--followers keep joining the charmed character only to get charmed themselves.

The enemy civilization grows so quickly that I can't send a holy man over immediatley to wipe it out. I can't raise/lower enemy land due to the scenario option. All I can do, I guess is go back and try to get a better score in a previous scenario. Does anyone have a strategy on how to get past this level?

Thanx,

Perry Pederson

This was, of course, a test to see if you were paying attention.
(Actually I tried to cancel that last post but for some reason we
can't do that from this site.)

Anyway, 3 months of full-time days would *really* be 30*8*3, which is
actually 720 hours. That's more like it.

Since I'm sending bits all around the planet, I might as well interject
a few more stats:

HacMan II:

15,000 lines of C code
About 3 months of work, not including art
720 hours, over a year and a half or so
US$3.50 * 720 = ~US$3000 if I'd worked in McDonald's instead

DC Snowball Fight:

2,000 lines of C code
About 3 weeks of work, not including art
3*40 = 120 hours
US$3.50 * 120 = ~US$540 if I'd worked in McDonald's instead

Blox:

3,000 lines of C code
About two months
30*8*2 = 480 hours
US$3.50 * 480 = ~US$1680 if I'd worked in McDonald's instead

This doesn't count any of the time put into the game library used,
which includes lots of assembly language stuff like sample-playing
routines and blitting functions. Neil Forsyth wrote most of the
blitting routines.

Anyway, back to your regularly scheduled flame war.

I got Llamatron a short while ago, but couldnt play it, since Ive only
an SM124. Anyways, I hacked together a composite monitor cable, and
now can play it (still wish I could afford an SC1435)

Anyways. I played it for about five minutes, and said to myself "This
is boring, so dull. Ill turn it off"... Well, I turned it off about
an hour or more later...

I revised my opinion of it. Its not a high enough opinion for me too
send money, yet... Maybe a few more sessions

Just MHO

>Don't forget that with the TOS 2.0 upgrade you get greater incompatability
>with your software. Considering that much of the ST software is either
>no longer supported or the company is out of business, that means you have
>to fork out more $$$s to get something similar that will function under
>TOS 2.0.

I have to disagree. I paid $60 for TOS 2.06. Ive a 1040STe, and it was
plug and play.

The $60 is well worth the additions that I got over 1.62. Desktop icons
are the biggest point for me.

I havent yet hit any incompatabilites with 2.06. Most of the problems
were STe-specific (such as the original Populous, and one other program
which I forget the name)

Of course. I dont mind not having multi-tasking. I am one person, with
one brain, and can only do one thing at a time. People shout, but you
can do this, while you do that! My STe is 75% MIDI related. Dunno about
anyone else, but too me, when I am working on music, 100% of my attention
is on creating music.

There are other things I would like. More DAs. But I hear MTOS fixes
that anyways. Hmmm, maybe I should say one other thing :-)

I am not a raving lunatic, as Dareks post puts him across as. No offense,
but when I read that, thats the first thing that came to mind. Flames
to /dev/null. I view myself as a user, with no firm loyalties (or
fanaticism). I know a few things, and I know that for my uses, an
ST does better than any PC can. And its more fun, not so mundane :-)
(I have an affinty for running machines that are on the non-standard
side. again, makes life fun)

6155. SST & '030 accelerators

Newsgroup: comp.sys.atari.st
Date: 1992-06-09 23:17:48 UTC
From: dud@hardy.u.washington.edu
Message-ID: <1992Jun9.231748.11011@u.washington.edu>
Source record: 221143

I bought a Mega STe and a Maxtor 120 meg HD about 4 months ago, and have been extremely happy with it. I mostly use it for DTP and a little CAD (for myself), writing papers, and calling local bulletin boards. The time is near, however, when I'll be wanting a 68030. MultiTOS will be most useful with one, and Randy Foster's new multitasking OS, which I plan to get, will pretty much need one. The Falcon looks like it will be nice, but it doesn't seem to be suited to what I want to do. I really don't like the one-piece design either. A TT is more what I'm looking for, but it's a bit out of my price range. So the next thing to think about is... '030 accelerators! I've been most interested in Dave Small's SST. Is anyone familiar with this? I have a few questions:

1) Will it work with a Mega STe, and if so, in the VME slot, or somewhere else?

2) Will it work well with MultiTOS (i.e. memory protection etc.)?

3) What is the "Chromax Super Video board already in rollout" that is advertised? Will it support the 19" mono monitor, and if not is there any way I can hook up a 19" monitor to the Mega STe with the SST in it?

4) Does it have a math coprocessor slot?

5) Can I use ordinary SIMMS as fast ram in it?

I would like to hear anyone's experiences with this product, or any other '030 accelerator (such as Fast's Tiny Turbo '030).

>anything that meets both criteria :-). Also, offering additional software
>upon registration is another motivating incentive.

One author that DOES do all of this stuff is Bill Aycock - author of
the "Calendar" series (up to version 6.2a, at this point), and a
number of other assorted little utilities. Handy STuff, when you need
it. When I registered Cal, he included a whole pile of other little
utilities.

"Unfortunately," registration does NOT add features - only "undying
gratitude", and encouragement to continue to release new versions.

This year, I decided to get around to registering my shareware.
Unfortunately, it didn't include any of Dave Baggett's games.

HackMan is sitting in an archive on one of my partitions. Nice
program, but I've only played it about 3 times. I guess that PacMan
lost my interest a few years ago, and the "new" edition didn't really
bring the love back.

I DID register Llamatron - but the issue is NOT that one game is good,
and the other is bad, but just that I preferred Llamatron.

One of these days, I ought to register some of that Unkuulian stuff.
As soon as I finish my thesis, and have income... It's 6 months since
I got stuck at one point, and lost patience. And that's been sitting
around in a .zoo file ever since... The unfortunate part is that I
seriously doubt that the hopes of the authors will be fulfilled, that
being that there would be a little money in it, and that there would
be encouragement to bring back "Infocom"-style adventures. A laudable
goal. Unfortunately, there's not enuf bucks in it.

Frankly, the authors should have probably kept the SECOND adventure
back as a reward for registration. That MIGHT have helped slightly.

The archive of SWI-Prolog at TH Darmstadt is

ftp.th-darmstadt.de:/pub/programming/languages/prolog/swiprolog/*

This is not the originator site. SWI-Prolog is only available here, because
it is used to build a special Prolog-Tool (PMAKE).

For questions please contact: kielmann@iti.informatik.th-darmstadt.de

I wasn't going to enter into this, but unlike Dave, I like writing
programs on the ST. I'd rather be programming than EATING at McD's,
let alone working there.

All we need is more sharing of sources so more quality programs
get written. I'm in a games phase now, so I means quality GAMES.

It is funny that you should say this.

Recently, my friend's Nintendo's RF modulator died and he was in need of
a play of RBI baseball. Anyways, I attempted to hook up my XE's RF-modulator
to his Nintendo.

The results was a VERY SHARP picture. I could not believe the sharpness
compared to his previous RF-modulator.

It seems like they don't build things like they use to... :)

Message-ID: <09JUN92.25654558.0030@UNBVM1.CSD.UNB.CA>
Source record: 221149

I've reached the point of frustration--the binary files I FTP'd
from the atari archive at Michegan simply will not execute or
unarc by the time I kermit them down from the mainframe. I've
tried Telix (on a PS 2), Flash Acc, Flash II, Uniterm, and
Gem Kermit. Either the download aborts or the program, when received,
does not run. Some even look right--helpful text in the ARC.TTP
file just where you'd expect it--but do not run. Can anyone help?

No he didn't make it up. Haruyasu Yoshizaki did. The full source code
(including Japanese comments) is widely available, but as it's originally
a MS-DOS program people are probably looking in the wrong place.

Lha 2.13 on the PC has *never* failed to undo anything LZH201x (ST) has
created.

> If nothing else, the mere fact that 90% of the lzh'd files I see
> nowadays are compressed with -lz5- means people are going to have to
> learn to get along with it, asn it's dubuious it will go away.

All new files should be compressed with -lh5- as it's still the best general
archiver on the ST. Sure there are other archivers that can make a better job
of some files, but -lh5- has the edge.

> unix hacker could write a portable version in C. People who are forced to
> use the program to access archives unpackable in any other way are
> unlikely to be well disposed to paying a shareware fee.

That's their descision, the simple fact that -lh5- is getting widely used on
ST/PC/Amiga shows that there is support and demand for it.

What possible reason would I have to spend that much time on something that I didn't like doing, and then to do it two more times? (And that's only counting the games.) HacMan II is free and always has been. Of course I like writing programs on the ST. The McDonalds wages are merely indicative of the opportunity cost. One would hope to do better than $3.50 an hour as a professional programmer; multiply it out with $30 and see what you get. All I've been trying to show is the opportunity cost, and the incredible gall people who feel that they *deserve* "free" software have. Nothing is ever free; someone had to pay to develop whatever it is in some way.

Fair enough. HacMan II is free anyway, so even if you had played it day and night for weeks you'd need feel no guilt. :-)

>One of these days, I ought to register some of that Unkuulian stuff.
>As soon as I finish my thesis, and have income...

See, here's the thing: A lot of shareware authors are probably in the same situation; that is, doing research towards a B.S. or advanced degree, with almost no money and no time to market a product. I think once people start to realise that shareware authors aren't a different class (that they are in fact *you and me*) then perhaps they'll view this whole situation in a new light.

Of course, I could be completely wrong.

> The unfortunate part is that I
>seriously doubt that the hopes of the authors will be fulfilled, that
>being that there would be a little money in it, and that there would
>be encouragement to bring back "Infocom"-style adventures. A laudable

Hmmm. It's obvious that there's not enough money if you sell them as shareware, but it hasn't been demonstrated that there's no commercial potential. Infocom's nose dive scared everyone right off that market, but who knows whether their trepidation was (and is) justified.

>Frankly, the authors should have probably kept the SECOND adventure
>back as a reward for registration. That MIGHT have helped slightly.

This sort of points out another problem, which is that holding back something that required as much work as your "real" product takes a lot of faith. It's also an incredible waste of effort (in my opinion) to work up a good 100-room game for only 20 people to play it. (Consider writing a novel for only 20 people to read; a decent IF game is a similar amount of work.)

The -lh5- algorithm is identical to the algorithm zoo 2.1 uses
(which is called AR002 by the way, and by Haryashu Yoshizaki (sp?))
so you can just get the sources for zoo from some ftp site...

But how did Jeff Minter make that much money then? Do you think he
knew how successful his game would be? I think that many shareware
games (and programs in general) are crap, because the programmers
are not good enough. Shareware is an easy way to try your
abilities in programming.

>>Isn't it
>>more satisfying if you really _know_ that some people
>>liked your program, and cared to pay $5 or whatever?

>friend.

This was not meant as an insult. But what else can it mean if you're
not getting any response, than that either people didn't like it
enough, or everybody is just dishonest? In the second case, why
did Jeff Minter make any money? I didn't tell _you_ personally
to try harder, because I can imagine that you worked a long time
on Hacman. But, IMHO, the concept just isn't one that could
attract many people at this time...

>It doesn't work that way: people do stuff if it gets them tangible
>positive rewards, whether they be fortune, fame, friends, or whatever.
>The carrot-on-a-stick tactic doesn't work. You just can't say, "Now
>that you've poured three months of your life into this game, write
>something *good* and then maybe I'll give you a couple bucks so you can
>buy yourself a sandwich" and expect anyone to follow along for long.

It doesn't work either to work for some time (no matter how long) on
a game and just because of this to expect it to be successful. A good
game requires more than a lot of work, like originality, for example.

>>On the other
>>hand, Jeff Minter's Llamatron reminds me of the times

>Again, give me a break. While I think Llamatron is very well-executed,
>let's face facts. You're choosing a ripoff of one game versus a ripoff
>of another. Both games are virtual clones of their arcade parents.

>(That's probably why neither of them is a commerical game, by the way.)
>Are you really making the claim that Llamatron is a better-executed
>clone of Robotron than HacMan II is of Pacman?

Well, give _me_ a break! Personally, I like Llamatron, Hacman I don't,
and it doesn't have anything to do with "how well a clone" it is,
I don't play games because they have good graphics and good sound,
but because of their _playability_, which Llamatron has, and
IMHO Hacman hasn't. I don't know if Llamatron is a shareware game
because it's an arcade clone, I don't think so.

>There's nothing wrong with liking Robotron more than Pacman. But don't
>extend that prejudice into an argument that says that Dave Baggett
>should try a little harder so he'll be up to par with Jeff Minter.
>That kind of argumentation is totally unproductive. This is not a "can
>you top this" contest between Jeff Minter and Dave Baggett.

I never said that _you_ should try harder, I just said that
shareware authors should try harder if they aren't getting any response,
and by trying harder I don't mean just working _longer_, but
trying to make some more _original_ games. You might say that
Llamatron isn't original, because it's an arcade clone from the
early 80's, but, for today's standards I consider it original.
Hell, I just like it more, can't I have my own opinion?

>> I just wanted to tell you
>>that in my opinion the shareware is the only _honest_ way of
>>selling your program.

>Grrr.

Sorry, I forgot freeware and PD...

What can I say? I didn't mean to insult you Dave, it seems I just
shouldn't have mentioned Hacman!

The -lh5- compression method was written by Haruhiko Okumura, then included into the lha 2.0 archiver by Yoshi, and then ported to the atari by Thomas Quester. The C-source of Okumuras compressor is available in the file ar002.zoo on CompuServe, but at the moment I dont know of any internet site. But never mind, you can look into the sources of zoo 2.1, it uses the original c-code of okumura; it is an interesting fact that the compressed output of zoo (only the data, not the header) in high-compression mode is exactly 2 bytes longer than the output of lharc, because it uses the same algorithm, but obviosly a different routine for storing bits in the output.

It sounds as if your ASSIGN.SYS file does not contain entries for the new screen modes of the TT. As well as the standard 01p SCREEN.SYS, 02p SCREEN.SYS and so on up to 04p SCREEN.SYS, you need

05p SCREEN.SYS
06p SCREEN.SYS
07p SCREEN.SYS

As well, with the corresponding fonts for each resolution after the driver name.

>
>But, as I said, only through BBSs and networks. What percentage of
>computer users has access to such networks, at this time?

Good point. People who routinely ftp software or download it
from BBSs are in the great minority of computer game players.
(It is very easy to forget this and think the net is The World.)

Then there are those shareware catalog companies who'll
copy disks for $3.00 a shot. Unfortunately, they seem to
be less than discriminating and will hype up and sell
ANYTHING they can get their hands on. I've bought from
such places before and if it was my only contact with
shareware then I'd have been permanently turned off.

For what it's worth, I think there is way too much garbage
floating about in the PD/shareware world. Dave's games
sound fairly nifty, but I'm talking about the "well I
just finished my first ever game program, a Pong clone,
so I'll put it out as shareware to see if I can make any
money" sorta stuff. Many times true gems are buried
beneath all the crap. It takes a very long time for
the word to get out; shareware programs are never reviewed,
etc.

A low-budget mail order company might do as well
as a shareware venture, and would probably be more
satisfying. And then there'd be no confusion as to
whether you were really in business and not just somebody
with ftp capabilities (the former definitely implies
some real commitment). I know, I know, it involves
a lot more work...

Sometimes I've ftp-ed files without first specifying BINARY. Don't forget to specify BINARY transfer when using Kermit as well. You've probably done this, but just a reminder.

What machine are you downloading from? If memory serves, UNB uses an IBM mainframe. Could it be a problem going from EBCDIC to ASCII?

>Does anyone know of such a great deal for us Atarians in the UK?

I purchased my Tandberg TDC3660 with five cartridges and photocopied manual
(for 216 pounds including VAT) from:

Matmos Ltd.
Unit 11
The Enterprise Park
Lewes Road
Lindfield
West Sussex
RH16 2L
Tel: (UK) 0444 482091

ps They are advertising a bare 20MB scsi Miniscribe 8225S 3.5 inch for
69 pounds + VAT

Thanks to those net people that pointed me to wustil. but unfortunatly I
can't ftp so still looking for an archive-server that has the TapeBIOS.

There should be lots of the QIC drives on the second hand market in the
next few years as upgrades are made to 4mm and 8mm DAT systems. Look out
for them!!

regards

Source record: 221004
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi,
I have an atari TT machine, one of the first with the daughter
board containing the 32 mhz 68030 on top of the mother board.
I would like to change the internal SCSI disk from 50 Meg to
a Quantum 120 Meg drive. Then connect the 50 meg SCSI drive to the
TT via the external SCSI bus.

(i) Has anybody tried upgrading the internal drive in the
TT machine. Will the Hard Disk driver support this type of
drive.

(ii) I have heard that there could be problems in using
two 'High Performance' SCSI drives on this model of TT,
when both are connected via the SCSI bus, any body
tried this !!

(iii) What sort of cables are needed, and where can I
get them from.

Thanks in advance

Andy

[pleas for disk based versions of TOS deleted]

(1) Ahem. What you are asking for is *illegal*. TOS is a copyrighted program.
So far as I know, *no* versions of TOS may be distributed freely. If you
want a copy of TOS, you'll have to get it from Atari (which will probably
involve paying them...)

(2) Disk based versions of TOS are unlikely to be useful to you anyway. My
suspicion is that you want these in order to run old games or whatever
that don't work with newer versions of TOS. But many of those games won't
work with disk loaded TOS either; they either access the ROMs directly
(bypassing the disk loaded version of TOS) or else make assumptions
about the locations of variables which are no longer true when the TOS
is loaded from disk. (This is personal experience speaking, here;
I have a version of TOS 1.0 on disk that came with my original 520ST,
and not much works with it that doesn't work with TOS 1.4).

>>problem. Software that people like *will* get around -- you can be
>>sure of that.
>
>But, as I said, only through BBSs and networks.

But that's my point: good free/shareware *does* make it into people's homes; even those people without direct online access. Remember users groups and PD disk services. I still don't think the distribution argument holds in the case of a decent shareware game.

>But how did Jeff Minter make that much money then? Do you think he
>knew how successful his game would be? I think that many shareware
>games (and programs in general) are crap, because the programmers
>are not good enough. Shareware is an easy way to try your
>abilities in programming.

You're doing what I warned against: extrapolating from the single maximal data point. I can think of a lot of reasons why someone like Jeff Minter might make a zillion bucks of a shareware game while your average Joe who writes a good shareware game wouldn't. Here are a few:

1. Jeff is British, and Britain is where the big ST games market is. My impression is that the UK magazines give more coverage to (and pay more heed to) stuff written by the local talent. This is a natural bias, I suppose.
2. Based in part on 2, Jeff got Llamatron on the cover disk of several of the big UK glossy ST magazines. Lots of "Darron-and-his-mate-Wayne"'s read those. I know one adventure game author that started getting 15-30 registrations *a day* as a result of that exact kind of exposure.
3. Jeff Minter has been a professional game programmer for many years. Remember Hover Bover on the 8-bit? That was an early Minter effort. There are several others that I don't recall as well. Being well-known helps a lot, I imagine.
4. Jeff Minter cloned one of the best action games ever:

Robotron. I can't think of any arcade game that's
as unwilling to fade from popularity except Tempest.
5. Luck.

>So why don't you release your programs as ocmmercial programs then?

Do you know how much work that involves? What, do you think you just call up the Bitmap Brothers one day and then get a royalty check the next? Selling things is a lot of work, particularly if you're a freelancer. The process also takes time: game companies will sit on things for months sometimes, and many won't let you do "simultaneous submissions," where you send your game to more than one place at once. I.e., it's a sequential process, and each step can take a long time.

Not to mention the fact that doing all that requires that you be home during business hours. It's not my job to sell ST programs. You can't expect shareware authors to be salesmen; that's part of the reason they're not releasing their things commercially.

Also keep in mind that some products are not viable as commercial products but are still worthwhile. I think Pacman is a good example. I like Pacman, and I wanted an ST version. Lots of other people wanted a good implemenation too. But we all know that something like that isn't a viable commercial product since it's a copyright infringement. We can certainly argue the merits of copyrights and whether writing a clone is "right" or "wrong" but the fact remains that there are some things people want to use on their computers that aren't marketable. This even includes utilities -- you'd probably never pay $39.95 for a print spooler, but you might say it's worth $5. Just the packaging alone would cost more than that; such a product couldn't be released commercialy, but is still an important contribution.

It seems like there's a lot of misunderstanding of the software marketing process and what it entails. I highly recommend that anyone who's interested in this issue consult one of those "how to market your software" books you can find in B. Dalton's or Waldenbooks. Being a salesman isn't easy; that's why some people get paid lots of money to do it as their full-time job.

>This was not meant as an insult. But what else can it mean if you're
>not getting any response, than that either people didn't like it
>enough, or everybody is just dishonest?

I think you're trying to make this black and white, which it isn't. It can certainly mean other things besides your two choices. Here's one: People love to get free stuff, but they don't want to be inconvenienced by saying "Thanks." For some reason we have a hard time doing that, even though it often costs nothing. When people express astonishment that I'd put all those names at the top of the picture formats list, I wonder what the big deal is: it's costs me nothing to do that (monetarily or otherwise), and it makes everyone who chipped in happy.

In any case, this discussion wasn't about HacMan II until you slammed it. If I was complaining about my lack of success (which was certainly not my main intention) it was with regard to Blox, not HacMan II, because HacMan II is free. You're welcome to do whatever you want with HacMan II, and I'm happy just to know that lots of people have enjoyed it. I had fun coding every single one of those 100 boards, even Figurit III and Spin Dizzy (which took me several days :-P). One group of people even named their parrot after Lurch -- now that's satisfying. :-)

>It doesn't work either to work for some time (no matter how long) on
>a game and just because of this to expect it to be successful. A good
>game requires more than a lot of work, like originality, for example.

How can you possibly make this argument when you think Llamatron is the best shareware game out there? Llamatron involves about as much originality as HacMan II: you take the basic concept and change the graphics some, add some new features, and presto!

What most Llamatron fans seem to be saying is "hell with originality, I wanna blow lots of stuff up!" I can identify with that. :-)

Llamatron is a great game. A really great game. But original? No. Ironically enough, I suspect that Jeff Minter's attitude about this was the same as mine: "I want to play {classic game} on my ST, so I'm going to clone it. That means I can't sell it commercially because I'll get my butt sued off, but I'm going to release it anyway." He took the risk of going shareware, which means that if Williams decides to sue him he could lose all the profits he's made and more. But they probably won't do that, so it's OK.

>Well, give _me_ a break! Personally, I like Llamatron, Hacman I don't,
>and it doesn't have anything to do with "how well a clone" it is,
>I don't play games because they have good graphics and good sound,
>but because of their _playability_, which Llamatron has, and
>IMHO Hacman hasn't.

And that is a *fine* opinion. But I would argue that the playability (or lack thereof) in each derives from the (lack of) playability in the original arcade game, since both are nearly absolute clones. See my point? I wasn't saying one has better graphics and sound than the other, just that both are faithful (in terms of playability, if you want to put it that way) to the originals. If you think that HacMan II is unplayable but Pacman is playable, that would be an interesting data point. I tried to make them equivalent. Several of my friends and I selflessly playtested for days on end. Every board in that game has been given at least an hour of playtesting -- some we tweaked for days until we were satisfied.

I agree with you that playablilty is *the* most important thing. If you've been following rec.games.programmer, rec.games.misc, or rec.arts.int-fiction, you know I couldn't care less about a game with snappy graphics and sound if it's not *fun*.

>I don't know if Llamatron is a shareware game
>because it's an arcade clone, I don't think so.

We can both only speculate on this; why not ask Jeff? Anybody on the net know Jeff personally?

>I never said that _you_ should try harder, I just said that
>shareware authors should try harder if they aren't getting any response,
>and by trying harder I don't mean just working _longer_, but
>trying to make some more _original_ games.

How would it strike all the Llamatron fans out there if I said, "I really don't need the 433rd Robotron clone that comes out of the shareware market, even if it does have animated robots and sampled sounds"? Everything you've said applies amazingly well to Llamatron. Technologically speaking, I'd say that the two games are very similar. Neither is original. Both have graphics that are much like the original, and both have sampled sounds. HacMan II is more subdued than Llamatron, but here again, Pacman is a lot more subdued than Robotron.

>You might say that
>Llamatron isn't original, because it's an arcade clone from the
>early 80's, but, for today's standards I consider it original.
>Hell, I just like it more, can't I have my own opinion?

You are, but you should realize that your opinion is *not* motivated by the originality of Llamatron, but instead by your preference for a shoot-em-up game over a maze game. Which is of course *fine*. But to extend this preference into an argument that says that "most ST shareware games, like HacMan II, suck" because they're unoriginal, and therefore don't deserve to be paid for, is unreasonable. IMHO.

>(or whatever it's now being called ...)

It's still called "Game Workbench," but without the "the." The most
recent date we've been given is early September. The code is done; the
documentation has been an immense effort and will take a bit more
time. (What good does it do you to have 450 functions if you don't
know how to use them?)

6190. Binary of MiNT aware Emacs

Newsgroup: comp.sys.atari.st
Date: 1992-06-10 15:11:23 UTC
From: sundsted@cis.uab.edu
Message-ID: <1992Jun10.151123.5118@cis.uab.edu>
Source record: 221029

I just uploaded the binary for the MiNT aware Emacs (which has been discussed here previously) to a.a in atari/new. It is called mntemcsb.zoo. Thanks to everyone for this fine program. I tried it out and it seems to work fine. Also included is a yow.lines file full of wonderful Zippy quotations for your /etc directory and yow.el.

Since these are not standard releases on Unix and they are not common among news-sites, I'd recommend compress/uncompress. It's also standard between all platforms (within reason, there's far fewer versions around). I can't say that about lharc.

6195. IN SPITE OF CONTROVERSY....(SHAREWARE : LOGIC SIM)

Newsgroup: comp.sys.atari.st
Date: 1992-06-10 15:51:57 UTC
From: Craig.Graham@newcastle.ac.uk
Message-ID: <Bpn02M.G25@newcastle.ac.uk>
Source record: 221038

CLA LOGIC SIMULATOR

In spite of the current controversy over shareware, Version 1 Release 1 of the CLA LOGIC logic circuit design and simulation package (announced a few weeks ago) will be made available via SHAREWARE at atari.archive in the next week or two.

This program represents two years of developement work, and (in our view) quite good. Registering gets you a BETTER version of the program, and properly printed manuals + distribution discs.

P.S. Could the owner of the .sig below (who doesn't have the guts to put his full name in his .sig) please NOT down load the program. I have not wish for an ignorant oik like that to rip off my hard work.

Source record: 220928

Being a Shareware programmer myself (ever use ANSITerm?), I have gotten quite discouraged about it. Many people in my local area and on FidoNet are raving about how "wonderful" the program is, but I've only recieved one fee, and that was from a 13 year old, several states away, who had stumbled across version 0.51 (a really horrible version of the program).
I've sent out shareware fees myself, but have recieved no replies... not even an indirect thankyou forwarded through a network. Nothing. One person in particular was Alan Hamilton, the author of XYZ 2.01. I sent him a fee that was quite a bit larger than what he had asked for, yet I have heard absolutely nothing from him.

As someone who would always have to send shareware payments overseas, I can say that the biggest hassle is just having to send money away. It costs extra to have the draft written out, and many banks do it so infrequently that it is a pain waiting for them to complete the bank draft. I am not exactly sure what the solution to this problem is. Third party money handlers are definitely not the way to go, but it would be nice if PD dealers could arrange payment when disks are purchased. We are dealing with human beings though, and I doubt they could be trusted :-).

6200. Re: SHAREWARE, discussion wanted

Newsgroup: comp.sys.atari.st
Date: 1992-06-10 17:56:23 UTC
From: greg@Quotron.COM
Message-ID: <greg.708198983@duke>
Source record: 221039

I think this whole discussion can be distilled into one question:

o Is shareware a Good Thing?

There are two answers to this, each from a different perspective.

One: Opportunity.
Without a doubt. Shareware, put simply, does what it's supposed to do: get software distributed at little or no cost to the author or the user. Dave Baggett has guessed that HacMan II is on 75% of the color STs out there. I'd bet that's just about right. It's on 100% of the machines I'm aware of. Not bad for one upload.
This, of course, gives a lot of people a lot of opportunity to try a lot of software at no cost. What else could anybody possibly want? In this capacity, shareware is just about as good as it gets. No salesmen, no limited return policies, no hassles. Just a download. Or an FTP, or a club library, or a disk borrowed from a friend. Shareware gives just about unlimited opportunity. From that perspective, it's great.

Two: Responsibility.
Where the concept has trouble is responsibility. People are more than willing to take advantage of unlimited opportunity, less than willing to take responsibility for what they've gained.
A lot of people I know look at shareware as a giant smorgasboard, where they can taken whatever they want, for free, and not gain any weight.
And that's wrong, I think. It's the same gimme-gimme-gimme attitude that left Wall Street a wreck during the 80's -- it's an utter lack of personal responsibility, or accountability. If you don't like a program, fine, great. Punish that author by not paying his registration fee.
But if you do, or if you use it for a month before deciding that you don't like it, or if you got half way through it before getting stuck at the dwarf with the rope, you should _pay_ for it. It's not the author's fault that it's a bother, it's not the author's that there's no 800 number, it's not the author's fault that you have to pay in pounds, it's not the author's fault that the last 10 shareware programs you looked at were lousy, it's not the author's fault that _______. There are a million excuses, none of which are valid. If you use, or have used, a program, it is your _responsibility_ to pay for it. The author has done enough simply by coding the damned thing.
If you're old enough to use the Net, your mother shouldn't need to nag you to do the things you're supposed to. Shareware authors

shouldn't have to it, either.
I've decided that I'm going to send Dave the money he wants for
Blox. I, personally, don't like the game (because it's &$^@ frustrating),
but he has done more for the ST community, especially the Net community,
than anybody else I can think of. Between HacMan, the Picture Formats
List, and Game Workbench, he's benefited me, personally, constantly
during my time on the Net. I expect he's done the same for a lot of
other people, too.
I'm not going to be thanking him for Blox with the money. I'll
be thanking him for everything else, and hopefully encouraging him to
do more. Charles F. Johnson, Jeff Minter and a dozen others all deserve
the same treatment. It's about time they got it.

6201. Atari ST booting up problem

Newsgroup: comp.sys.atari.st
Date: 1992-06-10 19:20:00 UTC
From: CHT510@SIRIUS.UKC.AC.UK
Message-ID: <9206101922.AA06476@ucbvax.Berkeley.EDU>
Source record: 221040

Hi,
I have an Atari STfm which will only run with a monitor attached (only tried with mono hi -res). On trying to boot it up with a television attached the ST tries to boot up in hi-res mode (with the monitor lead detached).

This is annoying since I can't run any programs that require colour and I wondered if there is any software available (or any hardware hints??) to make the ST boot up in low res modes.

thanks, adam whitham
cht510@sirius.ukc.ac.uk

Well, then you're doing your user group a disservice. Throwing away all
programs that are in some way incomplete demos is completely silly IMHO.
Maybe you have commendable moral standards, but then you are in the minority,
unfortunately. The plain fact is *people rip off shareware*. The small
inconvenience of having to send money to get the real thing is unfortunate
but necessary if the author wants to be reimbursed for his time. Sorry, but
I'm on the programmer's side here. You make it sound like the programmer
owes you the damn program. People should be grateful when a good programmer
writes a good program and charges a pittance like $10.

Also, your definition of "shareware demo" is wrong. What you're talking
about is *not* a demo, it is the complete final program. A demo is by
definition not complete. "Displaying the full usefulness of the program,
including save and print"? You call that a demo?

> Also, as a rule, user group members don't tend to pick up DOMs consisting of
> 'demoware' (with the exception of commercial software demos which they would
> like to see before they go buy the Real Thing).

What's the difference between commercial software and shareware? It should
be usually just price. Why is shareware any different? A shareware demo
is something "they would like to see before they go buy the Real Thing".
No difference.

Nothing personal, David, but I guess this is a sore point with me. I
get very annoyed when people make such a big deal about giving some poor
guy $10 for a neat little program. They'll argue for an hour, trying to
justify why they should send $10 to someone, trying to decide how often
they use it, is it really worth it, whether they know what a money order
is, blah, blah. And then they go and spend $10 on lunch.
Ok, I'm off my soapbox now. :-}

This is ridiculous, sorry. Who said "you can't use" a crippled program?
When done properly, you can get an excellent idea of what the program is like, you just can't do reams of useful work with it or play a game for 2 hours. If you could, Joe Average wouldn't register for the program.
This is a fact of life.

> discussion here certainly hasn't given me any reason to see even the odd

|>

No joke. I am serious. As for using GEM to manage files and archives and to look at docs for things you've just downloaded, I have one question for you:

Do you want to get things done prettily, or do you just want to get things done?

When I download an archive, I want to get into that beast as fast as possible. I want to read the docs (using a real viewer or editor) quickly. I _don't_ want to screw around with GEM or .ttp command lines. I guarantee I could unarchive and read the docs and use the new software much faster on my cli than you could with GEM. If you aren't a power user and you don't want to ever be one, then the GEM interface (for file management, etc.) is for you. I actually want to get things done. And what about mint? I can unzoo my files in the background while I am online or whatever. Very convenient.

As for word processing and other _productivity_ tasks, GEM is wonderful, and I like it. What we really need is a gem based archiver (like stuffit on the mac) which is compatible with zoo and arc on UNIX, where most of us live. But running .ttp programs from the desktop will never be anything more than a kludge--all the disadvantages of a command line system with the convenience of a GUI. Arrgh!

--Bill

P.S. About a robot doing my typing, the answer is 'no.' There is maybe 15 seconds worth of typing up there, much of it extraneous (used for the illustration). Unarcing a large file is going to take on the order of minutes, so a few seconds typing is clearly not a significant amount of time to consider a 'waste.'

Hi,
I was wondering if anyone knows of a good site to get either znet or streport? I used to get them at atari.archive, but there haven't been any new issues since April. I remember that one issue of znet gave an e-mail address to send subscriptions to, which would also be good, but I don't have that one anymore. Speaking of which, are there any places that have back issues available?

Any help would be appreciated....

Thanks,
Andrew Cullum (elvis@watserv.ucr.edu)

>reading that the FALCON is around $1200-$1800?
>

Well I have heard that base model TTs (2 MB ST RAM, 50 MB hard drive) are selling for around $1500 without the monitor. Add on a multisync for $400-$500 and you're set to go at a little under $2000.

As for the Falcon, obviously it is not released yet and we can't say what the list price will be, but most people seem to think it will be between $700 and $1200 in US dollars. Remember that although the Falcon does sound like it will have some really cool sound and graphics capabilities, it is probably not made to be a high-end, super high-performance machine like the TT (Or SST, Tiny Turbo upgraded ST(e)). It may not be 32 MHz like the TT and perhaps not have VME, SCSI, or extra serial ports like the TT (and I don't know if it will have a 68882 either). So, really the Falcon looks to be their new low-to-mid end machine, for the average user, although it looks to have very impressive stuff for the power user too.

I have got hold of a copy of the program since I posted that message,
and was dissapointed to find out that is doesn't have FULL ansi,
only Generic.
It's even listed in the ANSI code list that came with it about
redrawing the rest of a line being edited... It doesn't say it
doesn't support it, but it doesn't :-(, the ANSI code just
appears on the screen for me.

s> error message, and sometimes not).

It's worth noting that the performance of all currently released versions of FSM-Gdos is the same, if not worse. They are picky _in_the_extreme_ wrt to saved caches, config files, the existance of the font directory, you name it. You get an error message. (which is wrong - not enough cache memory? huh, I gave it a _megabyte_...)

s> I recall somebody saying recently that GDOS fonts come in two flavors,
s> Motorola and Intel, and that real GDOS won't digest one of those flavors
s> while AMCGDOS isn't so picky. If that's the case, it might account for

s> cache memory. It does not account for the bombing -- that's just
s> unacceptable program behavior.

Could be... I didn't test for that too much, I was so unimpressed (plus the fact that QTT and FSM don't get on well)...
I had it working, once. With more fonts, and NVDI 2.02 (or whatever version is current) it would probably be quite a good system. Hopefully the new Bitstream version will be better again.

>shoot-em-up game over a maze game. Which is of course *fine*. But to
>extend this preference into an argument that says that "most ST
>shareware games, like HacMan II, suck" because they're unoriginal,
>and therefore don't deserve to be paid for, is unreasonable. IMHO.

I think this posting was one of the most sensible in the (quite warm)
discussion.

We all have our preferences. I too like Llamatron because it brings
back the atmosphere of Robotron on the 8-bit (I never played the
arcade game - I've only ever seen it once in Australia). Pacman was
never my favourite game on the 8-bit (again, I rarely played it in
arcades), so I wasn't very good at HacMan II. But as far as PROGRAM
QUALITY goes, I'd have to say that HacMan II is a much better effort,
because it has that "completeness" feel about it, while Llamatron
always seemed unpolished. I would say that HacMan II (excluding the
issue of clonehood which covers both) is more like what I would expect
a commercial game to look like. Llamatron, with its flashing colours
(8-bit deja vu - yuck!), gaudy graphics (they're fun, but they still
look like random clip-art) and hacky title screen (looks more like an
Amiga sprite demo) looks less like a commercial game.

So. I really cant see the argument "HacMan II is not as good a program
as Llamatron" as holding much water. Better game? Well that's a matter
of opinion (as Dave said), and it depends not upon the author's efforts
(except in faithfully reproducing the original) but upon the player's
opinion of the original. HacManII, in fact, is much more advanced from
PacMan than Llamatron is from Robotron.

PLEASE...

Don't say a shareware product is BAD just because the type of game it
is doesn't appeal to you. I'm sure "STrabble" only appeals to a VERY
limited market (computer geeks being illiterate and all :-]).

6217. A DongleWare technique - discussion wanted

Newsgroup: comp.sys.atari.st
Date: 1992-06-11 01:25:09 UTC
From: warwick@cs.uq.oz.au
Message-ID: <8288@uqcspe.cs.uq.oz.au>
Source record: 221057

All this talk of the problems with ShareWare has got me thinking, and I think I have come up with a solution to at least one of the problems.

Imagine a program that was VERY USABLE, yet a better version could be obtained by paying a fee and registering the software.

Main problems:
1. High cost of delivering the better version.
2. It only takes 1 registree to give away a copy to kill the system.

My solution:
1. Include both versions (or all datam or whatever it takes) with the public distribution, but with the vital components for the better version encrypted.
2. When a user registers, they send their name and address (obviously, since they need the returned update), and receive a code which, IN COMBINATION WITH THEIR NAME AND ADDRESS, will create a decrypted version of the better version, with the name and address intrinsically part of the software.

The registree will hav a personalized version of the software. But the dishonest registree will not be able to distribute copies without dragging their name into the mud.

Now before you get all cranky telling me how much you hate CrippleWare, consider how CHEAPLY this could be done! The shareware fee could be miniscule, since the response could be so much better!

Also, you need not think that people would hack the program to work without the encryption, or with a removed name/address, unless you really know what you're talking about. I'm pretty sure this is all possible through the use of RSA public key encryption, but I don't have the know-how yet to implement it.

Sure, it's complicated. But here's the final enticement: It only needs to be developed ONCE, then everyone can use the same technique, perhaps using a generic tool to apply the decryption, etc.

I want shareware to work to compete against high prices of commercial software. "Lemmings" in Australia costs $80!!!!! (about US$60).

So, what are the problems with this idea?

My answer, personally, is both. I don't know about the new -lh5-
format that's been discussed recently, but _I_ still use UNLZH172.PRG,
a nifty little 8k program that unlzh's stuff with a GEM interface. All I
do is double-click on the archive (I have the program set up w/document
type .LZH) and click Extract w/Query, then mark the files I want
(README was your example I believe?), and out it pops. No switches, little
typing (not that I'm afraid of typing, but why waste time?)

Maybe not applicable in this case, but still easier! :)

The Cleveland Free-Net Atari SIG has it. If you have "telnet", you'll be
able to access it and read the latest issues of ST Report and Atari Explorer
Online.

Bruce D. Nelson has been contributing them every week for the longest time.

In fact, Free-Net gets them within a couple days after they are published.

I'll have to get you the telnet address later because I don't need to use it
and don't have it with me.

When you do get into the system, you would login as a visitor, type "go atari",
"9" for the Atari Library, and then "4" for the Online Magazine section.

I think the online mags are available from a year and a half ago.

6223. Atari ST Laser C STE incompatibility?

Newsgroup: comp.sys.atari.st
Date: 1992-06-11 04:40:36 UTC
From: billyg@tree.UUCP
Message-ID: <1992Jun11.044036.602@tree.UUCP>
Source record: 221067
Cross-posted to: comp.sys.atari.st,comp.lang.c

I have a question; Sorry about the use of two bandwidths, but this is a viable question, methinks..

I have been trying to compile a rather large VDI program on an STE with Laser C from Megamax. I bought it a year ago, and it compiled just fine on an old 1040 with 1 meg. Now, with the STe/4MB, I compile the program and link it.

It seems to compile just fine, with a few exceptions.. Using certain libraryns functions (e.g., sprintf, exit(1) (!!), etc..) will cause 4 bombs.. That's an illegal instruction vector, folks.. The package is compiling bad code...

Now, the question is, is Laser C incompatible with STe's? I have converted the program since to MWC, which compiles and executes just fine.. I'd like to use Laser because the compile and link times are soooo much faster. Second, if Laser C is incompat with STes, is there a patch in the works, and/or an upgrade planned any time in the future?

Thanks...

Source record: 221072

To transfer information between the Portfolio and a desktop Atari, you need to use the Serial Interfae, not the Parallel Interface. The software with the parallel interface is only for IBM-type machines, anf I believe that the parallel port in the ST is not a full implementation of the IBM-type parallel port. (In other words, it work work, even with an IBM emulator.

You'll need a terminal program for the Portfolio. I use XTERM, the one that is included on the DOS Utilities card.

You will also have to configure a null modem cable.

You just run terminal programs on both machines, and use file tranfers to exchange information.

Phew. It was only a minor bug in my code - I don't check if the picture
files load - so if you don't unpack the archive properly (eg. you only
extract the prg), you just get a blank screen, rather than an error message.

- Leo Hendry

There is a version of lharc for unix because i've got a version, it
is only a very early version but it handles 99% of everything i've got. It
also handles directories properly, i.e. makes them if not there, which I
something that all my ST versions don't do. If I try and extract an lzh file
with full paths in it either turns the path into an 8+4 filename, which can
end up all the same, or it just uses the final pathname and doesn't make any
directories. I hope this is a version of lharc that works like my unix one,
I asked before but got no reply.

This should be no problem. BTW, there are a lot of drivers on the market.

> (ii) I have heard that there could be problems in using
> two 'High Performance' SCSI drives on this model of TT,

It seems to me that I have the same machine version. I use a Fujitsu 2624S
as internal drive (1.7 MB/s transfer rate) without any problems.

> (iii) What sort of cables are needed, and where can I
> get them from.
Simply use the old cable and switch the drives. That's all there is to do.

6236. RTS/CTS Flow woes...

Newsgroup: comp.sys.atari.st
Date: 1992-06-11 09:11:54 UTC
From: jeroen@phil.ruu.nl
Message-ID: <jeroen.708253914@groucho.phil.ruu.nl>
Source record: 221073

Hi!

Using my fancy 9600 baud error-detecting data-compressing modem I'm running across the old RTS/CTS bug again and again. Of course, this is due to the infamous TOS (in my case 1.4) bugs, and there are many programs claiming to solve it: still, they don't. Not for me. Not without a little extra help.

Here's what typically happens (HS_FIX, TURBOCTS, lots of others):

* Switch on ST and modem simultaneously
* RTS/CTS works fine
* After a modem reset, or sometimes arbitrarily the RTS/CTS 'locks up'
The only way of overcoming this is switching everything OFF, wait about 15 seconds and rebooting... annoying.

With RS232ENC (included in Rufus 1.11 r 8 and 9) RTS/CTS is locked right on. Too bad...

With SERIALFX the best results are obtained. The serial port is locked after booting, but opening and closing the CPX module once solves that, and after that all is fine. As a result, you get stuck with having to enter the Xpanel every time you want something serial.

Now I find it hard to believe I'm the only one suffering from this particular bug! What's more, if I can manually 'unlock' the RTS/CTS there must be some way terminal programs can do this too. I think that wouldn't be a bad option, to assume the line is clear (and making sure it is) when starting.

If anyone has any idea what causes this particular bug, or how to solve it, I'd be interested. I'm sure others would be too.

Greetings, J.

Hello.

I am back to give you some new infos regarding the Falcon.
However, I signed yesturday a non-disclosure agreement with Atari, so I am not gonna give you many things :-(

What I am authorized to say is :

- The sound system has been modified. It now features full 16-bits DAC *and ADC*, stereo. The "RASCAL" processor has been trashed. This has been replaced by a very clever system, I can't say more but it's very great.

- The paddle ports of STE are back, and this time, Atari wants games to use them instead of "standard" joysticks.

- The machine is full of custom chips, to reduce cost. WD 1772 controler is being eliminated, replaced by a custom. So is the Yamaha sound chip.

- There are now Guidelines for developement.

And... more to come...

>TT-version around ?

Have you - per chance - checked the file "ASSIGN.SYS"? The screen drivers
for TT resolutions _must_ be included as well. Unfortunately I can't
check out for myself, since I don't own a TT, but this will most likely
solve your problems. Just tell me if it works...
I've just tried it out by removing the screen driver for St-High, and my
machine then crashes with two bombs. So I think just adding the TT-screen
drivers to ASSIGN.SYS will do fine!

Christian

P.S. Here is what you should insert into "ASSIGN.SYS":
(add or delete any fonts you like, but then to or from all resolutions!)

```
06p SCREEN.SYS ;TT-Medium (640*480)
ATSS10.FNT
ATSS12.FNT
ATSS18.FNT
ATSS24.FNT
ATTR10.FNT
ATTR12.FNT
ATTR18.FNT
ATTR24.FNT
ATTP10.FNT
;
08p SCREEN.SYS ;TT-High (1280*960)
ATSS10.FNT
ATSS12.FNT
ATSS18.FNT
ATSS24.FNT
ATTR10.FNT
ATTR12.FNT
ATTR18.FNT
```

```
ATTR24.FNT
ATTP10.FNT
;
09p SCREEN.SYS ; TT-Low (320*480)
ATSS10.FNT
ATSS12.FNT
ATSS18.FNT
ATSS24.FNT
ATTR10.FNT
ATTR12.FNT
ATTR18.FNT
ATTR24.FNT
ATTP10.FNT
```

| >Reincarnation: life sucks, then you die. Then life sucks again.

What do you mean, I don't have the guts to put my full name in my sig?
Read the headers on my postings. They should say thst the posting is from okes@essex.ac.uk (Oke S). Put that together with my .signature which contains the word SIMON in large letters and anyone with any brains will realise that SIMON is what the S stands for. Namely (sic), my name is SIMON OKE. That is my FULL NAME. I do not have a middle name.

By the way, I do not want/need a logic simulator. Even if I did I wouldn't take it from you, you snivelling flamer. And I do not regularly use ANY shareware packages that I have not paid for. Most of the stuff I use is commercial or free.

Consider yourself flamed back.

I don't know where you will find those incompatible STE-TOS but the M-STE I upgraded at our local dealer (Media Markt) last month had 1.44MB drives and the 'compatibles' (Highscreen, Profex ... with DOS 5.0) in which I tested the HD disks from the M-STE didn't complain

I can't know what it is like in the USA or the UK, but here in Austria
(and in Germany) most PD/Shareware libraries don't have non-german
games at all, most of them run on monochrome monitors only. Of
course, I've never seen Llamatron, R.O.T.M.C. or Hacman here!
I heard about Llamatron from a dutch disk magazine (ST News),
and the co-editor sent it to me (in case you were wondering).

>I think you're trying to make this black and white, which it isn't. It
>can certainly mean other things besides your two choices. Here's one:
>People love to get free stuff, but they don't want to be inconvenienced
>by saying "Thanks." For some reason we have a hard time doing that,

>that I'd put all those names at the top of the picture formats list, I
>wonder what the big deal is: it's costs me nothing to do that
>(monetarily or otherwise), and it makes everyone who chipped in happy.

I agree. When I posted my Naughty Unpacker to a.a., I only got one
response (on the first day it appeared in the Index). Two months later
I was told that it didn't work correctly with TOS 1.2 and 1.6. I never
asked anyone for money, but it seems that people don't even bother to
tell the author if there's a bug. I didn't have the possibility to
try the program out on other computers than my own, so I wouldn't know
if there was something wrong with it (a strange bug, by the way.
FSfirst doesn't find a file selected with the fileselector with
those 2 TOS versions, but it does with 1.0,1.4,2.05,... Any ideas?).
And there are at least 2 people who downloaded it, one of them
is currently beta-testing my program (Hi W. Alan B. Evans).
It's not easy to find bugs in a messy assembler-program (30K source)
which I had to disassemble once because I lost the source...

I guess that most people don't want to be inconvenienced even to say
'thanks', but I guess we've got to live with that. I wrote my program
primarily for myself, and thought it could be useful to some other
people too - perhaps it is. But I don't care if nobody uses it,
but if I'm not getting any response I won't make it easier to use,
or safer, or make it work on other TOS versions.

>In any case, this discussion wasn't about HacMan II until you slammed

>Figurit III and Spin Dizzy (which took me several days :-P). One group
>of people even named their parrot after Lurch -- now that's
>satisfying. :-)

Actually, I mentioned Hacman because it's one of the games on a.a.
I downloaded and I don't play. But, if I'm honest, when I ran it,
it looked well-made, i.e. smooth and easy to control. It _is_ the
best Pacman clone I've seen on the ST, and I would certainly
play it a lot if I wouldn't hate Pacman so much...

>Llamatron involves about as much
>originality as HacMan II: you take the basic concept and change the
>graphics some, add some new features, and presto!

Well, yes, but Llamatron is _different_ than all other games on the
ST, with crazy samples, weird sprites, and funny effects. OK, it's
a clone, but how many Robotron clones have you seen on the ST and
how many Pacman clones?

>>I don't play games because they have good graphics and good sound,
>>but because of their _playability_, which Llamatron has, and
>>IMHO Hacman hasn't.

>And that is a *fine* opinion. But I would argue that the playability
>(or lack thereof) in each derives from the (lack of) playability in the
>original arcade game, since both are nearly absolute clones. See my
>point? I wasn't saying one has better graphics and sound than the
>other, just that both are faithful (in terms of playability, if you
>want to put it that way) to the originals. If you think that HacMan II
>is unplayable but Pacman is playable, that would be an interesting data
>point. I tried to make them equivalent. Several of my friends and I
>selflessly playtested for days on end. Every board in that game has
>been given at least an hour of playtesting -- some we tweaked for
>days until we were satisfied.

I certainly do _not_ think Pacman is playable! :-) But I guess that some
people do, and thus I must admit that you were probably right when you
said that people just didn't want to pay, even though they liked
it. Sad, but true.

>I agree with you that playablilty is *the* most important thing. If
>you've been following rec.games.programmer, rec.games.misc, or
>rec.arts.int-fiction, you know I couldn't care less about a game with
>snappy graphics and sound if it's not *fun*.

I haven't, sorry... But I believe you! (You don't really sound like
a spotty 14-year-old-Darren 8^))

>>I don't know if Llamatron is a shareware game
>>because it's an arcade clone, I don't think so.

>We can both only speculate on this; why not ask Jeff? Anybody on the
>net know Jeff personally?

I can only mention that he didn't write anything about legal problems in
his read_me.txt that comes with Llamatron. He only wrote lots of things
about the shareware concept in general, and that he just thought it was
a better way to distribute a program. 100% of 5 pounds is better than
10% of 25 pounds he said! (Or something like that). I guess he was
very sure of his success.

>>You might say that
>>Llamatron isn't original, because it's an arcade clone from the
>>early 80's, but, for today's standards I consider it original.
>>Hell, I just like it more, can't I have my own opinion?

>You are, but you should realize that your opinion is *not* motivated by
>the originality of Llamatron, but instead by your preference for a
>shoot-em-up game over a maze game. Which is of course *fine*. But to
>extend this preference into an argument that says that "most ST
>shareware games, like HacMan II, suck" because they're unoriginal,
>and therefore don't deserve to be paid for, is unreasonable. IMHO.

I never said that Hacman doesn't deserve to be paid for (even though
it's freeware as you said (I didn't know that before...)), I said
that probably people weren't dishonest, but they just didn't like
it. All right, probably they just were lazy or didn't really care
to thank you, but that's the way people are, and we've got to live
with it - or stop writing PD/Shareware/Freeware games.
I still think there is hope for the Shareware concept though, it's
just not that easy to change the habits of all those users. And it
doesn't help either to say "it didn't work when I tried it so
I'm giving it up". Perhaps, the concept of Shareware will
be successful, perhaps it won't. But it's still worth trying to
support it though. (IMHO)

>the ST boot up in low res modes.

This is a hardware fault, however it can be fixed in software.
I use a mono monitor for programming, word processing etc. and a tv for games. However, as you know you have to unplug the mono monitor before you can use colour because it has a detect pin. To do this I would have to move monitor off the top of the computer which is right pain because I like to have all the wires neatly tied up. To get around this I fitted a switch on the monochrome detect line, however after about six months this came loose and I couldn't borrow soldering irons from school anymore since I had left.
I tracked down the part of the operating system that resets when you change monitors to the VBI routine. First of all I wrote a patch to exclude that part of the code and switch into low resoultion (This will fix your problem - Let me know if you want a copy), but many games need to be booted so I couldn't install my routine first so I disconnected the mono detect pin and changed the patch to switch into high resolution. I also patched the Setscreen so it allowed you to change into any resolution at any time (Not just between low/med). Now my system defaults to colour but switches to high early in the hard disk boot sequence. An auto program/accessory/program /gdos/desktop/game selector of my own invention allows you to switch back into colour if you wish.
NB: The patch is TOS version specific because it jumps back to the ROM VBI routine after skipping the mono detect to keep the code size down (much smaller than 1K). I use TOS1.2. Other than that the patch is UTTERLY compatable.

Laser C was a wonderful compiler enviroment. Pity it isn't
supported at all any more, and isn't compatible with
newer machines.

Try GNU C. It's a naff enviorment (ie. there isn't one) but the raw
power is definitely there.

Warwick has proposed what amounts to using a public key signature system to unlock the 'registered-only' features of a shareware program. The idea is good in principle (although I can see some implementation problems...we're talking about public key; decrypted in public, which is a harder problem than decrypted in private). The main obstacle is that public key cryptography is a minefield of patents, and any commercial use without licenses (unlikely to be affordable, because excessive use of a cryptosystem encourages development of better countermeasures), is likely to result in lawsuits. Doesn't much matter if you're right or wrong if you run out of the money and sitzfleisch to finish up in court.

That's the main difference between TOS 2.05 <-> TOS 2.06: TOS 2.06
work on every ST.

512 k should be enough, to run TOS 2.06. There is not enough memory
left to run Calamus, but that shouldn't work before launching TOS
2.06 ;-)

My company has over two dozen 520 and 1040 ST's, most of which are
in working condition. I have arranged for these to be donated to
a rural school system in an isolated West Virginia county with a
population density of only 10 people per square mile. The small-
scale agricultural tax base there provides for only the most basic
of educational tools; these machines will have a big impact.

We no longer have any Atari gurus here so I am appealing to you
for help. I need to provide the recipients with sufficient info
to enable them to maximize the utilization of these computers -
info like current sources for software, parts, and repair.
I can follow up on pointers to FAQ's, archives, vendors, etc.
Donated software would also be great. An Atari expert willing
to provide a few hours of phone support would be wonderful.

Want to really make a difference? I can probably arrange for
free lodging and meals in one of America's most culturally unique
and beautiful mountain locales - spend several days in a working
vacation helping with installation and teacher/student training.

Other ideas, info, publications, etc. are welcome. Your contributions
should be tax deductible (consult your tax advisor....).

6256. SVGA graphics boards for the TT

Newsgroup: comp.sys.atari.st
Date: 1992-06-11 17:46:11 UTC
From: <>
Message-ID: <bnell.708284771@ferrari>
Source record: 221095
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have a couple questions concerning graphics boards for the TT. I know of one made by gribnif and the reSolution board. I also have heard of the Matrix(?) boards from Germany but haven't been able to find a number or an address for them (If anybody knows of one, please let me know). I have also heard of some really expensive boards which are totally out of my price range (<$1000). If anyone knows of any decent boards that I haven't mentioned, please let me know about them. If I get enough info I will post my results later.

My second question is about adapting an IBM SVGA board to the TT. Don't say this is impossible, because nothing is impossible, just extremely difficult :-). The only problem with this is that I don't know anything about the EISA/ISA specs (anyone out there know?). I don't see why this wouldn't be possible, difficult, but possible. So any help would be greatly appreciated.

I think this would be very important to TT owners who want better graphics for a decent price. (You can get SVGA boards for the IBM for ~$100 as opposed to ~$500 or more for the TT). So, let me know!

Thanks
Bill

>Now, the question is, is Laser C incompatible with STe's?

You're probably running Laser C 1.0, right? Or maybe even 2.0. I forget the version number they fixed it at, but early versions of Laser C used some undocumented method to do I/O redirection in their output window, and as a result, once TOS 1.4 and 1.6 came out, it broke Laser C. With the version you have now, you need to keep running it on TOS 1.0 or I think TOS 1.2 will work.

I had the same problem when I got TOS 1.4 for my ST and I eventually got an upgrade from Megamax that fixed that problem. I just can't remember whether it was 2.0 that fixed it or 2.1. I don't even know if Megamax is in business any more so you may be SOL.

Hi!

I'm looking for a Common Lisp for the ST. The best I found so far is
CLISP by Bruno Haible and Michael Stoll.

Is anybody else using it, too ?

Is there another Common Lisp that conforms to the Standard as described
by Guy Steele ? Maybe including CLOS ???

Cheers,
Jan

>is it done in that I cannot get in after I telnet/ftp atari.archice.umich.edu.

Well, I am not sure if you just typoed, but its
"atari.archive.umich.edu" (notice the archi_v_e). However, if you have that
right, then it depends on what error messages you are getting (not getting).
If you get a message saying "unknown host", then it means that your name-server
is broken, and you should ask your system administrator to see if it still has
some static IP tables sitting around with old/outdated addresses (I had that
happen to me), or if they are having problems with the name servers.

If you don't get errors but are stumped at the login: prompt, then
first you have to make sure you are ftping NOT telenetting! Then you login
as "anonymous" and then for password you put your email-address: ie.
name@host.domain.etc. That should get you in. Don't forget to set "binary"
if you plan on downloading archived/compressed files.

>
> --Bill

I know, I bought mine for that in Sept. '85, but Darek is refering to
the developer prices for STs in _early_ '85, which were something like
$2000.00. As for the rest of what he said, he's gotten on Bill Gates
bandwagon, which is hardly surprising. I have no way of knowing when
NT will be out or how good it will be, while OS 2 2.0 is here now and
is the least expensive way to get a decent (meaning it also runs old
Windows and Dos programs) 32 bit OS on a Clone that has lots of memory
of both types. You should remember that OS 2's bulk is partly due to
the Windows 3.0 kernal it includes 8-). If I get a clone, I might
just get Darek's emulator so I can use Neodesk for file management
(let alone run Spectre or my ST programs, since I tend to buy software
only after I recover from hardware expenditures 8-).

6264. Legal TOS on Disk

Newsgroup: comp.sys.atari.st
Date: 1992-06-11 19:09:11 UTC
From: malay@sae.com
Message-ID: <1992Jun11.190911.26240@sae.com>
Source record: 221096

Where can I get a copy of the legal disk-based TOS that was released by
Atari for those machines that did not have a ROM-based TOS?? English Version,
please.

Maybe somebody out there can put together a "translator disk - a'la Atari 800/XL/XE"
for those rare occasions when a TOS-specific program is encountered.

Bob Malay

6265. Where can I find protected memory locations?

Newsgroup: comp.sys.atari.st
Date: 1992-06-11 19:18:32 UTC
From: paetau@mits.mdata.fi
Message-ID: <1992Jun11.191832.6533@mits.mdata.fi>
Source record: 220901

I'm programming a little application in assembler that is supposed to change the keyboard layout. It does that fine, and I exit with gemdos call $31, Ptermres, to protect my keyboard layout tables from being cleared on exit. The problem here is that the terminal program I use (FreeZe Dried Terminal 2.12) doesn't like programs that fail to release all memory when exiting from them, and so it displays a message saying "Program failed to release all memory" and throws me back to the desktop. Is there any way I can avoid using Ptermres, and use the normal exit method instead?

To Access the archives, you must do a couple of things...

Dial in with a term program that has kermit...

Set the modems to binary mode (8 bit):
Send a short break then type %binary on
send another short break and type %remote binary on

Set the kermit program to send the files in binary mode:
Put kermit in the proper mode by typing SET FILE TYPE BINARY
and then type SERVER, to get it into server mode
then, tell your kermit on your end to GET a file..

Hope this solves your troubles...

Later,

To add on with that, my 1988 520STfm costed $499.00 w/o any monitor.
I never saw an ST with mono for $799.00 in that year (1985) that's a
heck of a price if it's the 520ST with drive and the mono SM124 and not
to mention it's a list price.

6269. hdx5 on a SyQuest?

Newsgroup: comp.sys.atari.st
Date: 1992-06-11 19:59:48 UTC
From: skolodzieski@vaxc.stevens-tech.edu
Message-ID: <1992Jun11.145948.1@vaxc.stevens-tech.edu>
Source record: 221098

Hello,

I just recieved hdx5 in the mail from comp.binaries.atari.st,
it mentioned the modified shdriver.sys file for syquest use. It claims
that it is in a folder called alldrive/ that does not exist in the distribution.
If there are no legal ramifications, could some kind soul send me the complete
distribution, with all subdirectories in tact.

Cheers,
Scott Kolodzieski.

6270. gcc 2.1 vs gcc 1.40

Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Hello,

recently I got gcc2.1. I noticed the binaries are considerably larger
than 1.40. As memory always is scare on our ataries, I wonder if it is
worthwhile to use 2.1 instead of 1.40. Does anyone know about:

- real memory consumtion of 2.1 vs. 1.40?
- quality of produced executables (speed) of 2.1 vs. 1.40?
- compile time speed of 2.1 vs. 1.40?

Have you looked at the likes of Drachen from Germany?
Software such as this is easily up to the standard of the commercial
product. Then there are all the LLamasoft titles being released via
shareware. Properly supported a person in theory could make a living fro
it.

My $0.02:

I HATE not being able to SEE what I'm doing. I understand your dislike of .ttp, but have you tried NeoDesk with drag and drop? I routinely (when I must use a .ttp program) drag a file to be worked on to the .ttp program and quickly edit the resulting command line. For viewing, I have the DC Shower modules installed, and just have to double click on files and most archives (not all the newer stuff, alas) to view or extract them. I can even conveniently scroll or quit viewing files with my mouse buttons; quick and productive (hand never leaves mouse), IMHO. I do like having the ability to make and use shell scripts, which can then be called inside the GUI, or not, as I please, but I hate having to remember *EVERYTHING* when running normally in my cli. I keep in mind maybe two sets of instructions to make my computer do things: C and the program I am working with. For most archivers and other not too frequently used programs, I am always looking up such details as: what command line args are used by this program, what is the path and name of the target file (GEM displays this constantly in another window), what is my current path (or did I remember to rehash after compiling that new program), etc.,etc. This is why I LIKE Arcgshl and its brethren, not only do I avoid typos (thank God for Tcsh at work) but I also don't have to remember all the options, since I can see them (or a simple way to get at them) all the time when I am using a graphical shell. How many times a day do you have to "man this" or type "that -h"? It's a waste of time that I put up with now, but will be glad to say goodbye to forever!

Do you begin to see why I heave a sigh of relief when I go home to see all my files displayed as icons and can lasso them or shift click select them for a single move or copy, instead of half a dozen ls and mv commands for all the different extensions? The best example of painful cli performance is when I have to bring all my Usenet files home starting from an arbitrary date/time. The first time, I had to ask for help, then I had to look up "find" in the cryptic manual to see how to use it, next I had to do an ls -lt to get what date/time to start copying from. Even though a shell script cuts down on the complexity, the whole scheme is needlessly complex and arcane - to make it bearable, you need to program the shell. On my Atari, I set the file window to show file date/time, and to order the files by

date, then I lasso all the files after the first one with the right date/time, and continue all the way up to the file that I want to stop with destination; I 'm done! Note: it's hard to stop at an arbitrary date / file with Un*x and no script, and yes, Neodesk makes this a lot easier, especially if you have to scroll your file window. I readily admit, if we're talking about files that can be wildcarded easily, I'll use the cli.

Do you see me relax as I fire up arcgshl and see all the archivers are available to me with similar interfaces that help to remind me to extract this archive with its paths intact, do you see me smile as I click on the proper buttons to do it instead of typing "zoo -h" and writing the proper sequence down on paper? The difference between GUIs and character based shells is like going down to the basement with a flashlight, versus turning on the lights before I go down. Sure, graphical interfaces have bugs, e.g. I would'n go back to straight GEM easily at all, but NeoDesk, TOS 2.06 and Gemini do what I want pretty much, and with other enhancements our graphical environment productivity will go up a lot. Hmmm, how about a graphical "connect the icons" interface to create shell scripts??! Maybe I should get working on it 8-).

Thanks for letting me get that off of my chest folks 8-).

use a 50-60hz switching program and then it works fine on the English
version.

> name and address intrinsically part of the software.

It's been done...sort of.

Freeze Dried Terminal looks for a registration key on startup and
if it is not found, disables certain features. When you register, you
get a key which contains your name, address, etc. I don't know what
possible _legal_ recourse such a thing could offer, but it does make
"illegal" copying tracable. (Is it really _illegal_ to copy the registered
version of a Shareware program? Further, are statements placed in some
Shareware that say "You must register or destroy this program in x days"
legally binding?)

> and buy a TT (ha!) at least I'll have that game to play.

Thanks Mike! Just to clarify, the Bard's Tale fix doesn't do anything to
TOS, it lets you run most of Bard's Tale from a ramdisk if you have enough
memory (I didn't write this one). This magically also makes it work on
newer TOSes, but I have not been able to test it on 2.0x or 3.0x. If
someone can try this, post the results.

The Rogue fix (which I did write) works on all TOSes 1.0 - 1.62, I also
could not test on 2.0x/3.0x. Again, if someone tries it out on Mega STe/TT,
post the findings.

These games are both well written and a good example of portable coding,
both were written in '86 or '87. Rogue was the first ST game I ever bought.
Another great old program is Sundog, which works perfectly on TOS 1.6.
Sundog was the first major commercial ST game ('85?).

Could you .LZH this thing and put it up on a.a? I've never seen it and it sounds better than spslidex. Also, spslidex has this neat little bug. If it is run in a directory with all .SPU files and you hit uncompress (I think...) it will erase all the .SPU files! I'll check this at home, but I am almost sure it is correct. (I did this once by accident and lost about .5Mb's of pictures!)

I believe, correct me if I'm wrong, that the "wolf" is short for
Wolfenstein a.k.a. Castle Wolfenstein. CW was a really cool game that was
out for the now defuct Apple II series. The 3D part is obviously about
the 3D graphics the new version has.

>April issue of Current Notes, page 73, quoted the SuperCharger at US$450.
Don't know much about the pricing of the SuperCharger, or if ICD even sells PC emulators, but I have this quote from Current Notes, May 1992, Vol. 12, No. 4:

Lexicor has determined and confirmed that its former distributor and product manufacturer is making and selling PIRATE copies of Lexicor's software products.

If you have purchased any Lexicor products from RIO COMPUTERS we suggest that you make the following test to see if you may have purchased a PIRATED program.

[The following have been condensed and paraphrased...]

1. Check the SERIAL.NUM file to see if it is different from the label on the disk. Also, check the file's date stamp. It should read 02/03/28. Check the date stamps of the .NUM and .PRG files. If they are more than a minute apart, you have a PIRATED program. If the numbers in the "About" dialogues are not the same, you probably have a PIRATED program.
2. All numbers can match and the programs may still be pirated. Identical programs have been sold to more than one person. There have been cases where the numbers match and where they do not.
3. What should you do if you suspect you have a pirated copy?
a. First, call Lexicor and tell us why you think you have a PIRATE copy.
b. Next, if instructed to, send your PIRATED goods to Lexicor.
c. If you have been one of the victims, we suggest that you file a complaint with th US Postal Service's fraud division and the US Postal crime detail. You can get the information for yor local postal crime unit at your local post office.
4. Lexicor policy on these PIRATED goods: If we can determine that the software you have is stolen we will confiscate it for use in possible legal action and as evidence. WE will, as a courtesy, replace your goods when we receive proof of purchase from RIO COMPUTERS. Lexicor cannot warrant any of these PIRATED goods. If you have purchased any such product and send it to Lexicor and you receive a replacement and a refund then you should send that money to Lexicor. If you do, Lexicor will reinstate the warranty.

[stuff about copyrights, etc. deleted...]

Lexicor has ceased all business activites with RIO COMPUTERS and urges all
Lexicor owners to buy from an authorized ATARI dealer or direct from Lexicor.

>

I have not seen this game, but I have been told that it is not like Castle Wolenstein the original. Also note that CW made it onto many other systems as well, although I first saw it for the Apple II and thought it was great. When I got a version for my Atari 800xl, I played it all the time AND it blew away the Apple version (graphics wise, the play was the same).

wolf3d is for the PC, not apple II.

Im sure someone else will probably point this out, but one of the biggest
reason for putting your address in sigs is so to let your address be known
exactly. Lots of news and mail software, and gateswates, etc, munge the
headers something fierce, and sometimes it isnt easy to trace to your
address back from the headers

>Just curious, how much is TT prices these days? Wouldn't the
>FALCON's release bring the TTs down under $1000? Since I've been
>reading that the FALCON is around $1200-$1800?

Rumor is that the Falcon will list for somewhere between $700 and $1200. Speculation is that the Falcon will replace the STE. A model of the Falcon with a detachable keyboard would replace the Mega STE. Finally, in the next couple of years, a 68040 version of the Falcon will replace the TT. Note that Atari hasn't said anything about this; it's just speculation of those on GEnie. Take it with as much salt, pepper, and other spices as you'd like. :^)

I doubt the TT's price will go down any more. Apparently, it's very expensive to make. Of course, I could be wrong and Atari could lower the price tomorrow. :^)

(Oh, BTW, I forgot to answer your first question. :^) The TT in the US is about $1500-$1800 with two megs of RAM.)

Aaaaaaarrrrrrrrgggggggghhhhhhhhh, with the ram based version of TOS 2.06
in an 512 KB ST minus the XCONTROL there's about 70K of free memory left.

The program will refuse to run in such a situation, because there's absolutely
no point.

>their name into the mud.

This is a good idea. Why limit it to updates only? A developer/shareware
author could upload an encrypted version of their software to a public
place like Genie, Compuserve or anonymous ftp. Included with the encrypted
software would be a program to simultaneously decrypt and personalize the
program. The developer could also include a key which would decrypt the
software, but in a DEMO MODE only. If the user liked the software, they
could send away for a personalized key.

Note that this does not require public key encryption, which is good.
You're going to have a lot of patent problems if you need public key
encryption.

OK, here's my old sig (minus silly quote):

email: okes@essex.ac.uk
#
##
##
#

and here's the new, improved version:

This signature is copyright 12/6/1992 Simon Oke. All rights reserved. If you like it and keep a copy for your own use, you owe me $20. Please pass it on to your friends with all documentation. Email okes@essex.ac.uk.

Will this do?

I really don't want to cause a big flamewar in this group, but I do object to Craig Shergold's remarks in his earlier posting (which was along the lines of 'I have uploaded this package but you can't have it if this is your sig, and why haven't you got the guts to give your full name?').

What am I doing wrong? I can get on with people face to face, so what's the big difference here?

Simon.

CHU> To add on with that, my 1988 520STfm costed $499.00 w/o any monitor.
CHU> I never saw an ST with mono for $799.00 in that year (1985) that's a
CHU> heck of a price if it's the 520ST with drive and the mono SM124 and not
CHU> to mention it's a list price.

I got my 520STm with a SS floppy (ugh! :^) and mono monitor for $499 in
January 1987 (520 STfms, Megas, etc, hadn't even been announced yet,
Neil Harris was still Atari spokesguy, etc, etc), I am absolutely
certain of the price because I had to cash in every last piece of change
I had to buy the thing, I bought it at CompuClub in Framingham, MA.
(They were an Atari-only dealer, out of business now, of course). It was
easily the best bang/buck available at the time. I was also considering
the Amiga 1000 but I was a poor student and the ST was *much* more cost
effective for me. The ST even came with actual software: First Word, an
early version of NeoChrome, and a couple of other things...

As far as being easier to use, gimme a break. The Atari 8-bits were,
actually still are IMHO, the best 8-bit computer ever made, but the ST
had far more horsepower and ease of use just due to raw technical
advances.

However, I must say, in the 8-bit's favor, when I got the oppportunity,
I sold off my ST but I kept my 8-bit. The 8-bit has better games and
more nostalgia value. For me, the 68000-based ST was just another box
whose time came and went, it was never as inspiring as the 8-bit and
when the time came, it wasn't very difficult, emotionally, to sell off.
(Now I've got 68030 and 386 boxes. :^) The Falcon (if it ever goes into

actual general consumer distribution) seems like it will be more like
the 8-bit than the ST in this respect.

>| Rasmus Paetau (paetau@mits.mdata.fi) | Waiting for the Atari Falcon |

I don't know why you have to run your program from FDT (If you're not and FDT is complaining then there is something stange going on with FDT), but if you must then you could try to save the table at the end of the screen memory. There is 32K-32000 bytes free there (At least on STs, I would guess its still there on STEs for compatability) because before STEs the screen memory had to be on a 32K boundary and the screen is 32000 bytes long. Obviously this a very dodgey trick and will fail on TTs, falcons and anything Atari make in the future, as well as possible clashes with other programs doing the same thing. But then it sounds like FDT would fail on new machines anyway so it doesn't really matter.
The "legal" alternative is to have an auto program that sets aside some memory intercepts a spare trap (say #3) to return the address on that memory if a "magic number" is on the stack or in a register (and calls the old routine if not, just in case trap #3 is ever used). The auto program would terminate with Ptermres and your keyboard remapper would do a trap #3 to find the address of the memory and terminate normally.

>
>I've heard that when the Falcon is released, both STe and Mega STe
>will be withdrawn from the markets.

This is clearly cr*p because a 520STe's RRP is currently #280 in england and the Falcon is predicted to cost #600 which is bound to be an under estimate. The Falcon is aimed at a totally different market.
As for the Mega STe, this has a separate keyboard and is aimed more at the serious market. However, it is very overpriced at the moment and is going look alot more overpriced if/when the Falcon comes out.
I think the TT is most likely to be discontinued, if the Falcon 040 with separate keyboard rumours are true.

>- quality of produced executables (speed) of 2.1 vs. 1.40?
>- compile time speed of 2.1 vs. 1.40?

One of reasons that executables of gcc 2.1 are bigger are that you
are getting two (or three - depending on compile options) compilers
in one. Namely C, C++ and Objective-C. If you are dabbling in C++
then combined compiler is actually quite a bit smaller than two
separate beasts. There are also differences in a generated code
and optimizer is more aggresive. I do not have any quantitative
measurements (anybody with a set of numbers?). If this is worth
for you - I do not know. 1.40 is pretty capable compiler on its
own and in this moment more stable than 2.1 (or 2.2 in a few days)
but this will change and you are hard pressed to run into problem
areas.

>could send away for a personalized key.

The author of the TX2 file viewer (and, now, editor) does something like this. Once registered, the user would receive a separate 'unlocking' program, and a key word to type in for any particular version of the program. This would modify the shareware program to become fully useful ... i.e., the mouse was enabled, and certain 'uncritical' options were now usable. Actually, the program was automatically usable in 'DEMO MODE'.

In article <2686@isgtec.isgtec.com>, ken@isgtec.com (Ken Newman) writes:
>Well, then you're doing your user group a disservice. Throwing away all
>programs that are in some way incomplete demos is completely silly IMHO.

Actually, it makes good 'business sense'. User group members pay a small sum for the DOMs--to cover download time, disk and label costs, and wear and tear on the club's STe disk drives (formatting and copying 100+ disks a month can generate a lot of wear and tear). They don't get DOMs which contain 'crippled' or 'partially useful' shareware demos. Period.

As for the for-profit PD libraries, I can only say that if I paid for a disk which contains an 'incomplete SHAREWARE demo' such as the one for a grammar checker that appeared within the past years, I'd demand a refund of my money!

(The demo in question is usable, it just has an annoying "pay for shareware" message, and a 10-second delay, after every questionable word/phrase it finds. How can I evaluate its effectiveness using a large text if I have to wait several hours for it to go through the text in the first place!?!)

>The small inconvenience of having to send money to get the real thing is
>unfortunate but necessary if the author wants to be reimbursed for his time.

Fine. Just don't call it SHAREWARE. Call it DEMOWARE, or something similar. The term 'shareware', as coined by its creator, meant that the user got a full working program for which, after an evaluation period, she could either pay the shareware fee or stop using the program. It has only been the last few years in which the ST community (and, I would suppose, the Intel-clone community) have been subjected to folks claiming the 'shareware' title for what are effectively crippled demo programs.

>Sorry, but I'm on the programmer's side here. You make it sound like the
>programmer owes you the damn program.

Nope. But a programmer owes me a clear definition of what to expect when I run the program. Labelling a crippled demo program 'shareware' is NOT the solution. It isn't shareware -- it's a demo of a program for which the programmer expects money before I can get a full working program, and then provides no recourse if I decide the program isn't worth the shareware fee after all.

For the rest of this article, I'll refer to such programs as 'sub-commercial', meaning that the author expects full payment before providing the user a chance to use a full working program.

>What's the difference between commercial software and shareware? It should
>be usually just price. Why is shareware any different? A shareware demo
>is something "they would like to see before they go buy the Real Thing".

>No difference.

A) If it isn't a full working program it's not Shareware. It's a demo of a sub-commercial program.

B) Commercial programs get reviewed in the Atari ST press, most sub-commercial programs are never reviewed.

C) Most of the methods authors of sub-commercial programs have used to 'cripple' their demos are

1) insulting
2) annoying

Check out a commercial demo sometime. The people who produce them make every effort NOT to annoy or insult the person using the demo. The Arabesque demo, for example, doesn't put in 10-second delays after every action.

>Nothing personal, David, but I guess this is a sore point with me. I
>get very annoyed when people make such a big deal about giving some poor
>guy $10 for a neat little program. They'll argue for an hour, trying to
>justify why they should send $10 to someone, trying to decide how often
>they use it, is it really worth it, whether they know what a money order
>is, blah, blah. And then they go and spend $10 on lunch.
>Ok, I'm off my soapbox now. :-}

I have absolutely no problems paying for a shareware program. I've done it quite a few times. I DO have problems with certain authors of 'crippled demos posing as Shareware' who expect me to have a favorable view of their program after looking at a menu bar, or who cripple their demos in such a way that I have no idea of the program's performance. I'm especially upset if I obtain the program at a cost (download fee from GEnie, for example), and the program isn't labelled anywhere in the description as a 'crippled demo'.

>Does anyone out there in netland have any advice on how to go about
>jumping into this game? Any evaluations would be welcome, too.

Not long ago I did a post requesting peoples' opinions of this game
(and UMS I). The responses I got ranged from puzzled to hostile.
So many people felt they'd been burned by this program that I'm a little
nervous about saying anything in its defense. But here goes:

As you know, UMS II comes with only 3 scenarios (Alexander the Great,
Napoleon, and Overlord (D-Day))--and they are each massive. I understand
the package was to have originally included an editor that would enable
you to construct your own scenarios, but it was not ready by the
publication date and was left out. That omission was, I believe, this
package's Achilles heel.

For with SMALLER scenarios, the game speed is much better--still slow,
yes, but acceptable. (Ever play a chess program--ANY chess program--
with the skill level set high?) The scenario editor would have allowed
one to make smaller scenarios and actually allowed one to PLAY the thing.
(The majority of people who responded to my post said something like:
"I loaded a scenario, made my moves...and then gave up waiting for the
computer to do something; haven't touched it since.")

A scenario editor would also have allowed you to experiment with all
the adjustable variables, and kind of get your feet wet slowly. For in
this game--and this is one of its great strengths--EVERYTHING is
adjustable: terrain effects, morale, tech level, time, weather, you
name it. Playing around with these variables in a huge scenario is
unquestionably overwhelming for the newcomer--but do-able (and educational)
on a smaller scale.

So: the original package would have received a better welcome had it contained a scenario editor or, failing that, a smaller learning scenario. But it didn't.

But here's the good news: a scenario editor (called "UMS II PLANET EDITOR") does exist, and may even be ready for your machine as you read this. I have seen a playtest version of it, and it has made me very excited about a program that heretofore had been deadwood on my shelf. Also, an updated version of the UMS II program itself is available, and I found gameplay to be faster (even, for example, on their large Civil War scenarios).

So don't junk your copies of UMS II. Have a look at the Planet Editor, and give it another chance. It is an extraordinary program--no kidding!

As I have not seen many other VT-100 emulators, I can't say if it's better, but ANSITerm is 100% vt-100 compatible and as vt-102 compatible as I could make it. It's most important feature is that it can display 16 colors, the IBM extended character set, and blinking text.

I'm sure your right, Bill, difficult, but not impossible. I am familiar with
ISA/EISA spec, however not with the VME (isn't that what's in the TT?) bus.

The next problem would be to make it emulate something TT software would
understand.

As an STe owner, I want to explore the possibility of hanging a graphics
card off of the DMA port.

Regards,
Doug

>aa384@cleveland.Freenet.Edu (Doug Wokoun) writes:
>
>> It's been done...sort of.
>
>> Freeze Dried Terminal looks for a registration key on startup and
>>if it is not found, disables certain features.
>
>This is just ASKING to be cracked. Or maybe you shouldn't have told
>everyone what it does...

Well, I just repeated what is in the FzDSTerm documentation:

| The .KEY contains your name, address, phone number, serial number, etc.
|Much of this information is displayed when you first load FzT and when you
|click on the FzDS symbol on the main menu. I advise you to not give out
|your .KEY as it can easily be traced back to you by anyone. Its easy for you
|to check who a particular .KEY belongs to, and if its not yours, you are
|expected not to use it.

Aaron is aware of the potential for "cracking":

|3. If I EVER find or hear about a "cracked" .KEY (one not generated by me,
| containing bogus registration info), I reserve the right to either:
| a. Immediately change the format of the .KEYs, causing all registered
| users to have to get new .KEYs.
| b. Go back to the old method, taking away this great way of operation.
| If people can't repect my right to only allow people to use all
| parts of FzT only if they've registered, I don't see why I should
| make it any easier for them.
|
|4. If I ever find someone giving out their .KEY to other people, I will
| cancel their registration and make their .KEY invalid for future versions
| of FzDSTerm. If they want to be eligible for upgrades, they will have to
| pay again. If I feel that their .KEY has been spread around too much, I
| may choose to do any of the following under #3.
|
|NOTE: If you ever come across a .KEY that is not yours; send it to me, and I
| will make it worth your while. I would like to know if a key is being
| spread around. Either print a Hex dump of it and mail it to me, or sen
| it to me on Hitchhikers.

> This is a hardware fault, however it can be fixed in software.

??

I think the problem here is that you're trying to boot up from a disk set at high-res .. UNPLUG the monochrome monitor and put in a disk set at Low or Medium res in the drive (you change this with your GEM desktop). Reboot the computer after you have plugged the TV in (or the GEM desktop will do it for you) and everything SHOULD work.

The best solution is to connect a full size keyboard. I got mine at
Dick Smiths back when I had a Spectrum. The keyboard maxtrix is very basic
layout. Hope this helps. I think you may have trouble sourcing a genuine
membrane nowadays.

Tell me the ANSI code it's ignoring and I'll see what I can do. Are you
having trouble with editing terminal codes? I decided that I probably
wouldn't need to add any of the editing codes.... so I suppose it is
generic.

To shareware authors: Avoid making a statement like this! "If any of you is bad, I'll punish you all!"

This is a weakness in that author's DongleWare technique that should be avoided, IMHO.

6324. Falcon memory design, how sis it done?

Newsgroup: comp.sys.atari.st
Date: 1992-06-12 19:51:15 UTC
From: paetau@mits.mdata.fi
Message-ID: <1992Jun12.195115.19319@mits.mdata.fi>
Source record: 220960

How is the Falcon memory design done? Does it use SIMM modules? If so, how is the 14 Mb mode achieved (I doubt that Atari can fit 14 SIMM slots in a standard ST case along with the internal HD and everything else). If it used 4 Mb chips then the max RAM would more logically be 16 Mb than 14 Mb.

So don't use it. Not everyone has the same tastes as you. Many people can
benefit greatly from good shareware.

> If what you have is good enough to sell, sell it. If you can't afford to
> market it yourself, take it to someone who can. If it isn't good enough
> to sell, then give it away. But don't tell me I am obligated to pay you
> money for it since you made it shareware.

You've obviously never tried to market software with a major distributor.
It is very hard to get a company interested in your software. You have to
have a very good feel for the market and be in the right place at the right
time. And the competition is intense. A lot of computer software of all
kinds is at the saturation point right now. Especially if it's not for
the IBM PC. As I said in another post, the obligatory form of shareware
just doesn't work. The "please send me money if you like it" type of program
doesn't work because of people like you, for example. Try reading the
readme file that Jeff Minter wrote for Llamatron. Big companies suck up
all the money from your program anyway. There are about 10 other reasons
why shareware is a Good Idea.

> Pirates couldn't
> afford to buy the stuff they steal. Therefore, while what they do is
> illegal, immoral, disgusting, and filthy, they really don't reduce
> sales of a product significantly.

Nonsense. Sure some pirates are kids with no money but a lot of pirates
have plenty of money. This is a dumb over-generalization. Even if they
couldn't afford to buy *all* the stuff they steal (since they steal so
much), they could in most cases afford to buy a few things that they don't.
Companies lose big to piracy. Why do you think they spend so much time
and money on copy-protection?

I don't know where you were looking, I worked at a computer store, we sold the whole system, color for 999.00 and the mono for 799.00. All day. We were always backordered. (I believe we purchased them from Atari for approx. $200 less than retail. (If my memory serves me correctly.)

In fact, I paid 999 for mine in Sept. 85.

6328. DON'T DEAL WITH L&Y COMPUTERS

Newsgroup: comp.sys.atari.st
Date: 1992-06-12 21:46:21 UTC
From: jhurwitz@access.digex.com
Message-ID: <1992Jun12.214621.6430@access.digex.com>
Source record: 220970

```
**********************************************************************
* *
* DO NOT BUY OR GET SERVICE FROM L & Y COMPUTERS !!! *
* *
**********************************************************************
```

PLEASE READ THIS MESSEGE ABOUT HOW L&Y COMPUTERS SOLD ME A BAD

COMPUTER AND GAVE ME TERRIBLE SERVICE

This started out when I wanted to buy a Megs ST 4 to run a Moniterm monitor and eventually a SST. Unfortunatly,{I bought a Mega 4 from L&Y with 2 Megs in it (I should have suspected something right there) and it worked fine for a week. It was when I had ATN put the extra two megs in that we saw the mother board and suffered a good amount of damage from some previous incident. The power supply had been replaced, two of the IC sockets were replaced, there were sockets for the upper two megs of RAM but no RAM chips, worst of all, there was a trace that had been broken and mended with solder. When I brought the machine back two weeks later they didn't give a damn. They said I took the computer home and burned it out. ATN tried to fix it twice and and L&Y tried twice and could'nt fix it. No amount of arguing or evidence could persuede them that the machine was messed up before they sold it to me.

On top of that they had the worst service. They would tell me the machine would be ready on such day and they would call me. I had to call them to see if the machine was done everytime. They took at least 10 days each time to work on the machine. They Would not give me an itemized bill with a description of the services performed. They ignored me when I was in the store; I had to wait almost two hours once to to get my macihne back. They forgot to put the cpu case screws back in the case or even give them to me. They forgot to give me back my power cord. I had to call and tell them twice they screwed up. They promised they would get the screws and powercord out in UPS ASAP. Never sent them. They still have my mouse from the last time I picked up my machine, I'd call, but the mouse isn't worth me hassling with them again.

I could go on...this sort of treatment/sevice or lack there of, is inexcusable. I won't buy anything from them ever again and suggest you do the same. The only improvement that L&Y could make is to go out of bussiness and stop ripping people off.

If you want to know of two excellent Atari dealers try Toad Computers 301-544-6943 for support and service or Advanced Technology

Networks 301-948-0256 for support and service. Both of these places offer good quick service at modest prices, are well educated and are happy to help you with any questions you may have, just call Them.

This is not an ad for Toad or ATN.

This is a warning to the Atari community that L&Y computers has questionable business practices.

#>MF> is MUCH slower than before. I currently use Crawio() to put text on the
#>MF> screen and Bconin() to get text data from the modem. Does the ST have a
#>MF> faster output routine than Crawio()? If I would like to continue using
#>
#> Yes... Use Bconout, raw mode if you don't need screen control, or normal mode if you do.
That is what FIDOdoor uses and it redraws screens very quickly (and works well under
mint/multitos).
#>
#>"MICRO"
#>
#
#Obviously if you use Bconout you lose redirection (although it doesn't matter
#in this case).
Also note that using Cconws to print several characters at a time in the
#hope of reducing the TRAP overhead is a bad idea because Cconws calls Bconout
#though a TRAP call anyway.

If you call Crawio Crawio calls itself for each call Bconout, but if
you use Cconws Conws is called oncce (GEMDOS TRAP) and afterward
each character will call Bconout (BIOSTRAP) But this way you save
n-1 GEMDOS TRAPS ! (N is the number of bytes to Output !)
You may also use Fwrite ! (which is more transperent !

Gruss
Wolfgang

>

I must of felt the same way with the 8 Bit as you did Kent, once I had an
ad in the paper for my whole 8 Bit setup (800xl, 1050, and the 1027) for
$300.00, a person across town came by to buy it. After sitting there
testing the hardware and doing demos, he was about to pay up. AT THAT
last second I refused the money and said "sorry I can't sell this". The
ATARI 8 Bit will always be the favorite of mine, right now I can sell off
the ST and not even feel emotional. I guess with my 030 and 486 I really
don't feel that attached to the ST as I did with the 8 Bit days. I also
had a C64 with my 800xl, it didn't last a month with me same with my long
gone AMIGA.

DP> anything that meets both criteria :-). Also, offering additional software
DP> upon registration is another motivating incentive.

I agree somewhat. My main program (FIDOdoor) is shareware, $25 US. It is fully functional, except for allowing only 5 message areas (128 registered), and a "unregistered" note at the bottom of all messages posted. I am quite sure that if I had released it without needing a key to make it fully functional, the returns would have been MUCH lower than they are. Of course this software has a very limited (Sysop) market, but I think the same things hold true on the overall shareware market.

One thing to note however, is that I initialy wrote FIDOdoor back in early '88 because I needed a bug-free message editor, not to make great gobs of money. By doing this, I now know a LOT more about C and writting code, than I could have gained by spending thousands of dollars on high-priced college courses. If you want to write non-commercial software, and make lots of money, program on a PC. Even if the program is so-so, there are a 1000 times as many people who will look at it, and possibly send
you money. I personally cannot stand DOS (or windows), and IMHO the only decent op-system for those machines are possibly OS/2 and of course, unix (I would really like to see Solaris 2.0 ;^). What I really want is a Sparc 10, but with my budget...

I have the following complete system forsale. THE SYSTEM IS CURRENTLY
compatible with ST software, PC software, and is ready for MAC emulation,
and ATARI transformer. READS AND WRITES 720K PC/AT disks, and ST formats
also.

*ATARI 520STfm with 1 meg RAM, 720K internal 3.5" Drive
With internal clock and calender, keyboard
anti-static pad, 9 pin extender for easy access, and
TopCase Cooling FAN (LOW NOISE) for the POWER SUPPLY
SPECS:
MC68000-8Mhz 32 BIT internal/16 BIT arch.
MIDI IN/OUT
RS-232 port, Parallel port, HARD DISK PORT,
Floppy Disk port, TV port.
ROM cartridge port
VIDEO RGB/MONO PORT
VIDEO card built in for low, medium, and high rez.
Emulates MAC with GCR 30% faster than the MAC
(GCR not included)

*BEST MOUSE (2-button oval shape) w/pad

*External 360K drive

*RGB color monitor ATARI 1124 w/ swival monitor stand

*External HardDrive Case with Power Supply (Ready for HD)

*about 400 3.5" 720K floppies with case holders.
Many titles that still have original boxes.

Such Titles as:

PC-Ditto software.
SPACE ACE
WAR IN THE MIDDLE EARTH
FIRST WORD
SHADOWGATE
BAAL
WAR CONSTRUCTION SET
OGRE
OBLITERATOR
THE PAWN
and more...

*BOOKS such as GEM programmers reference from ABACUS
MANUALS, MAGAZINES, AND ORIGINAL BOXES are included.

BUYER GETS EVERYTHING ... $600.00

Is there anyway to overscan an SM124 Atari monochrome monitor? Is it actually possible on an SM124 for the electron gun to scan the borders, or is it limited to inside the borders?

Conan.Ford@Debug.cuc.ab.ca

The Apple Macintosh LCII has 4 megs soldered in and 2 slots that accepts 4MB SIMMs. This should bring the machine up to 12MB, but no - the MMU can only handle 10MB. Maybe Atari has done something stupid like this...?

Umm, well I renamed the mercury dir to merc as Hermes was finding Mercury
and using some of the config stuff from it.

About polling, are you running uuwork or uupoll?
you need to run uuwork [hostname]
use the hostname if you don't have the xhosts file set up to auto poll
at set times, using the hostname will force a poll straight away.
make sure you have the info needed in xhosts to tell uuwork what number
to ring, speed, login id/password etc.

s> error message, and sometimes not).

It's worth noting that the performance of all currently released versions of FSM-Gdos is the same, if not worse. They are picky _in_the_extreme_ wrt to saved caches, config files, the existance of the font directory, you name it. You get an error message. (which is wrong - not enough cache memory? huh, I gave it a _megabyte_...)

s> I recall somebody saying recently that GDOS fonts come in two flavors,
s> Motorola and Intel, and that real GDOS won't digest one of those flavors
s> while AMCGDOS isn't so picky. If that's the case, it might account for

s> cache memory. It does not account for the bombing -- that's just
s> unacceptable program behavior.

Could be... I didn't test for that too much, I was so unimpressed (plus the fact that QTT and FSM don't get on well)...
I had it working, once. With more fonts, and NVDI 2.02 (or whatever version is current) it would probably be quite a good system. Hopefully the new Bitstream version will be better again.

6342. TOS 2.06 and Ajax chip

Newsgroup: comp.sys.atari.st
Date: 1992-06-14 00:18:37 UTC
From: al@ms.uky.edu
Message-ID: <1992Jun13.201837.18910@ms.uky.edu>
Source record: 220977

Two friends of mine upgraded their Mega STe's to the new Ajax
chip with 1.44M drive, and TOS 2.06. They've found that the external
drive seems to screw up the functioning of drive A if it is connected
at all, whether it's on or not. Anybody else had this problem? Is there
a known bug (ALREADY) in TOS 2.06, or better yet, a fix? Thanks.

Chris Dotson - al@s.ms.uky.edu

>>seperately?

>I bet they have a bunch of 1040s and Megas left and will sell those
>until the Falcon come out in the Fall...

>I'm sure someone has the 520 left though.

Well in Australia they seem to have discontinued the 520. I had to buy
a new machine last week when my venerable 1040STf expired. A 520 would
have been fine since it's going to 4Mb as soon as I get the case open :-)

Alas, no 520s!! However I was lucky enough to find a dealer who sold me
a new 1040STe for $599 Australian. The list price is $895 and the 520
when it was available was $695, so I can't complain. I was surprised
at the price Atari was charging for 2x256K SIMMs, though.

The dealer, if anyone's looking, was Quadrant Computer Centre, 5A Quadrant
Mall, Launceston, Tasmania, and they had about 10 left at that price.

> ADC*, stereo.

Thank God!!! I hope this is true in the final version. Folks, this feature alone could guarantee the Falcon's success as a pro MIDI machine. Currently, direct-to-disk digital audio recording systems cost $1500-$3000 and require external hardware (Atari Sound Tools, Digital Master, etc). With the above-mentioned hardware, all you'd need is some good software and a decent-sized hard disk. Extremely cool.

Imagine doing your MIDI sequences at home, recording vocals over them at CD quality, and being able to manipulate those vocals for editing, remixes, etc. before dumping to DAT or analog tape. Atari would be all over it.

>
>

I got FSMGDOS as an upgrade to Wordflair II. It costs just $US35.00, and comes with 4 typefaces. It's a little buggy with TOS 3.01 (occasionally get 2 bombs with large typefaces or when I re-define the page to be larger, or when I define a new point size on the fly), but at least the installation programme warned me about this (now if my local dealer could only get their hands on a copy of TOS 3.06...).

I remember someone once said here that FSMGDOS was no longer being offered by Goldleaf. Well, according to a mail order ad in the June issue of AtariUser, they ARE still selling it with Wordfair II, so unless the ad is lying, this person was wrong.

Hi,

I am using the Drvmap command in 'C' to determine if drive B: is connected
to the system, HOWEVER it always says that it is connected, whether it is
plugged in or not.

Even if I unplug drive B: from the computer, Drvmap still says its there.

Why??

Any ideas??

Is there a better way of checking for the existance of drive B:??

Thanks in advance.

Concerning the questions about Wolfenstein 3-D, and whether or
not it's going to be ported to the ST, I asked Scott Miller,
president of Apogee Software, the distributor of Wolfenstein 3-D,
whether there were any plans to make an Atari conversion.

This reply is from Jay Wilbur, president of ID Software, the
actual programmers of the game.

#: 48940 S6/Gen Fun & Games [N]
12-Jun-92 11:58:57
Sb: #48598-New Apogee games?
Fm: Jay Wilbur 72600,1333
To: Bob Retelle 76702,1466

>A number of people in the Atari ST newsgroup have seen Wolfenstein 3-D on
>friends' computers and have been wondering if you (or ID) had any plans to
>port it, or any Apogee games to the ST...?

I cannot speak for all of Apogee's games...just for those done by Id Software.
There is no plan to port Wolf or Keen to the ST. The closest we'll come is to
a Wolf port to a different Atari box--the Lynx.

Jay, Id

Well Dick Smith here sold off all there Atari stock, cheap, STE520 were $445nz
and STE1040 were $545nz, all the better type software was out at $39nz, ie,
1st Word Plus, LDW Power, PC-Ditto, Flash 1.6 was $29nz,
all the Timeworks titles..

One small problem was that these STE's had the DMA bug, and Dick Smiths
did not know a thing about it and how to test for it, you see they never sold
hard drives...!!!!

I ended up getting some new DMS chips from Atari OZZ, but guess what even one
of the new chips was stuffed...!!!

And does it
have the infamous mouse-wrapping problem that most resolution-switchers have?
You switch from medium to low, and the dialog boxes are drawn in two pieces,
each at one edge of the screen. The horizontal travel for the mouse also
consists of going all the way from the left edge to the right edge,
reappearing at the left, and to the right again.

One simple way is to check for the bad chips C025913-38 or run the machine for
36 hours a try writing to the hard disk, renaming a file it ok, but back up you
hard disk first, if you have the faulty chip you directory gets screwed..

Not all machines show the fault strait away, mine was left of for 2 days for it
to show, must be heat related ..??

I cannot speak about hardware problems, but first of all you have to
write a complete VDI device driver for the graphic card and its
resolutions. The performance and the compatibility of the system will
mainly depend on this device driver! So choosing a graphic card should
also include considering its software.

Regards, Markus.

I think you may have something, there. The new, TT resolutions have their
own drivers built into ROM and these *must* be called to avoid a crash.
Exactly the same thing happens if you try to use an ASSIGN.SYS file which,
say, only calls the medium resolution resident driver in low or high res.
Where you would only normally put screen.sys calls up to four, try the same
thing up to 9 or 10.

6357. Hard Drive and Atari ST software for sale

Newsgroup: comp.sys.atari.st
Date: 1992-06-14 16:25:34 UTC
From: poulin@acsu.buffalo.edu
Message-ID: <BpuGAM.x4@acsu.buffalo.edu>
Source record: 220998
Cross-posted to: comp.sys.atari.st,misc.forsale.computers

I have the following ST software titles for sale:

Sundog $15
Gridiron (football) $10
Dark Castle $20
Leatherneck $15
Personal Pascal $15
Questron II $20
Winter Games $15
Midi Maze $20
Silicon Dreams $10
Hollywood Hijinx $15
Flight Simulator II $15
ImgScan (printhead
scanner) $25
Oids $20
Dungeon Master $20
Carrier Command $20
M Williams C v3.0.5 $20
Assempro $20
WordUp v1.30 $20
bc (calculator) $10
Revolver v1.0 $10
Micro RTX $10

40 More Great Flight Simulator Adventures (book) $10

I also have a hard drive kit with what I believe is a blown power supply.
(The fuse keeps blowing). It comes with a case, ICD host adapter card and
diskette, and an RLL controller. The boards look fine (nothing blown etc.).
If you are handy with electronics, this can be yours for $125

Seagate ST277R 80 megabyte RLL hard disk $200

Everything for $350.

I'll pay shipping on prepaid orders.

6358. Falcon Status

Hi all,

For those of you who can talk, a couple of questions about
the falcon:

1) Latest price thoughts.
2) Video modes.
3) Ram expansion limits.
4) and of course..... when......

I know that all of this is still realtive until it actually
shows up on the street, but I am still thinking of a TT, but really
dont have the $$.....

Ziggy.

Let's see, where should I start? The reSolution boards are only for the
Megabus in the Mega STs. They haven't been adapted for the VME port, as far
as I know. One dealer told me the developer was working on an adapter, but
this was several months ago and I haven't heard anything since.

I've heard that the Matrix boards are real nice, but I think the documentation
and interface is in German. If you know German, that's great.

Gribnif's Crazy Dots boards are excellent. Get one if you can afford it.

CyberCube's Skyline and Serenade I've heard are good as well. I don't know
if you can buy them yet and I don't know how well they interface with current
software. They are expensive though.

Finally, there's Lexicor's long-awaited Leonardo board. I think Jay Craswell
is still tweaking the output on it. He wasn't satisfied the first time.

>I think this would be very important to TT owners who want better graphics
>for a decent price. (You can get SVGA boards for the IBM for ~$100 as
>opposed to ~$500 or more for the TT). So, let me know!

I have a Mega STE and I want better graphics at a decent price, too! :^)

I saw a program at a local board that tests if the machine has the DMA
bug, but if the bug is present, the test will do several damage to the
files on the HD.

> you) and everything SHOULD work.

Bollocks.
A desktop saved in high resolution will boot in low resolution if a
monochrome monitor connected. On a fully functional ST it is IMPOSSIBLE to
get high resolution unless you have a monochrome monitor or something else
which wibbles the monochrome detect pin connected, unless you patch the VBL
interrupt.
If you'd read what I said you would know that EVERY VBL the detect pin is
checked. If it is low and the resolution is high the machine is RESET. If
it is high and the resolution is not high the machine is RESET. If you don't
believe me disassemble it and look for yourself.

Personally, I turned Write Cacheing off, then had the drive running for
hours using it. The DMA bug showed up when I started to get WRITE errors
(Using ICD software, it appears in the top right side of the screen)
At first I was getting 5 hours at a time, but after a few days, it would
happen after only 2 hours.

There is the Reflex Graphics Card, from Titan Designs (a UK company). I
can't remember the price off hand, but I can dig out their details if you're
interested.

The card allows 1280x960 big screen monitors and A4 full page displays to be
used. The card fits Mega STs, and TTs as well (I think).

Sorry this is so vague, but I don't have the information to hand!

>
>Why??
>
Steve,

Drvmap reports the existance of drive B: because the internal drive can act as drive A: and B: providing "virtual-disking". This is why you see a dialog box saying "place disk in drive A: and press return" if you refer to drive B: which isn't connected. B: will exist as a logical drive.

>
>Chris Dotson - al@s.ms.uky.edu
>
I've got a Mega STe that came with a built-in 1.44M drive and TOS 2.05.
Drive A will not function at all if the external drive in turned off,
but works fine when it is on. I haven't heard of any fixes for this.

By the way, I also noticed that extended formats don't work too well
with this configuration. Diamondback format, although it is supposed
to be designed for 1.44 drives, terminates without error, but then
the disks won't have the proper amount of room when I check (for example,
20 sectors/track and 80 tracks gives about 1 meg). MSA also didn't work
correctly. Is this because the TOS is only 2.05? Does anyone know of any
fixes?

6368. GCC 2.1 (getting it going)

Newsgroup: comp.sys.atari.st
Date: 1992-06-15 03:49:51 UTC
From: avp@garfield.cs.mun.ca
Message-ID: <1992Jun15.034951.1762@cs.mun.ca>
Source record: 220803

I thought I had GCC 2.1 up and working right, but I'm not sure
any more. I have a program that the first instruction is a
printf, and it crashes (2 bombs) before it even does that. When
I Downloaded all the stuff, I found I didn't have the crt0.o lib
file. So I DLed the libsrc80 file, found crt0.c and compiled it.
Is this OK? Is there anything else missing? any ideas?

I also couldn't get the debugger to work (GDB). I have a symbol
file created and stuff, but still no go.

I ahve gotten small stuff to compile and run, but the prg I am
working on now is a little bigger. So I don't know if
GCC is looking for something different in the libs or something.

Any help greatly appreciated. My crt0.o file is 2435 bytes, is this
right?

Thanks in advance.

6373. Re: Floppies: Sun to Atari

Newsgroup: comp.sys.atari.st
Date: 1992-06-15 07:53:13 UTC
From: gehnen@relax.informatik.rwth-aachen.de
Message-ID: <gehnen.708594793@relax.ert.rwth-aachen.de>
Source record: 220866

The Problem of trashing files on the Floppydisk is just a little one.
Mtools uses only the first FAT on the Disk. The ST reads only the second one.
Blurps, thats the Problem... :-(
The Solution is: After using the Floppy at the Sun, you have to copy the first
FAT to the second FAT. You should do this with a good Diskmonitor or a
special program. This Program is just a little thing. I do not have the
sourcecode (C) with me at this time, but its small enough to post it in
Source.

I will do it in the next days.....

So long,,
Gerrit.

Hi,
I'm trying to take control over my Roland Sound Canvas (SC-55) with
my Atari using Turbo C 2.0.

For system exclusive MIDI messages, Roland requires the last byte to
be a checksum. Of course, I'd be glad to compute it and give to the
needing thing, but HOW? I don't know whether to add or xor, or which
bytes to take into account, I can't find anything. Trying it out
takes too long; on every wrong checksum, the canvas displays
"Check sum error!" for about 1.5 second.

If anybody knows anything on this subject, please mail me!

Thank you for reading!

Maarten Landzaat, BSO/Aerospace & Systems, qb7g6@fel.tno.nl

6375. Problem with Turbo C's TCC

Newsgroup: comp.sys.atari.st
Date: 1992-06-15 08:39:32 UTC
From: qb7g6@fel.tno.nl
Message-ID: <1992Jun15.083932.6175@fel.tno.nl>
Source record: 220872

Hi!

I just can't get the commandline versions of Turbo C 2.0 to work.

Hardware: 520+ (1Mb), Megafile 20.
Software: TOS 1.0 (!), Gulam or standard desktop

When I use TC, everything's fine; it produces working executables.
When I use TCC and TLINK, it produces executables with exactly the same size, same file permissions (as far as I can see with gulam and the standard desktop), but they give me bombs. It's just your basic "Hello, world" program. Sometimes I get the message before the bombs appear, sometimes not.

I don't have a proper file comparison utility, so I don't know whether the contents of the executables produced in the 2 different ways are equal.

Using gulam or the desktop does not make any difference.

I want to use the commandline version, because I want to use elvis/vi and make, because I'm used to these lovelies at work.

I would greatly appreciate any suggestion, hint, or perhaps solution!

Please mail to maarten.landzaat@fel.tno.nl

With reference to the speed of UMS 2, try switching hidden movement off. Apparently this gives quite a speed up, so I've been told. Apparently the AI in early version of the prog was a bit dodgy. For an example, play the D-Day scenario. The computer has this embarassing habit of attacking the coastal forts directly, instead of going round them and cutting their supplies off. It keeps on doing this until it runs out of ships, even using supply ships towards the end 8-)

6381. LOGIC SIMULATOR RELEASED TODAY

Newsgroup: comp.sys.atari.st
Date: 1992-06-15 10:03:46 UTC
From: Craig.Graham@newcastle.ac.uk
Message-ID: <BpvtAA.10C@newcastle.ac.uk>
Source record: 220876

```
CLA LOGIC SIMULATOR
===================

After a rather prolonged delay, where a few ugly bugs appeared at the last minute,
CLA LOGIC will be posted to atari.archive.umich.edu today.

The file to download is:

CLA_V1R1.LZH

The final spec. for this version 1 release 1 is as follows:

- Full hierarchical structuring of designs.

- A quite nice GUI.

- User definable keyboard shortcuts for all functions.

- Interactive simulation, with the following tools:
- 20 trace logic analyser
- 'Active' probing
- Monitoring bulbs, for those 'quick little checks'
- Variable propogation
- Auto clocking inputs at definable frequencies
- Manually setable inputs
The simulation functions are fully integrated and accessable at any time.

- GDOS output of circuit designs & test results.

- Library module facilities:
- Predefined libraries
- Library module loading.
- Design merge
- Librarian program for maintaining libraries

- Fanout checking (74**, 74HC, 74LS, CMOS, ETC)

This was a summary of some of the nicer features of the program. There are many
more features actually in the package.

PLEASE NOTE THAT CLA IS SHAREWARE......

>about ProLog?? Thanks,

I haven't heard of any LISP compilers, but if you mean interpreters,
check out XLisp (from version 2.0 it's object-oriented too).
Again, I don't think there are any Prolog compilers for the ST, except
for Maxon Prolog (which is a commercial product), which I think has a
compiler. Good prolog interpreters are prolog68 (I only have an
experimental version) and Turbo Prolog (it's predecessor).

|> I am using the Drvmap command in 'C' to determine if drive B: is connected
|> to the system, HOWEVER it always says that it is connected, whether it is
|> plugged in or not.
|> Even if I unplug drive B: from the computer, Drvmap still says its there.
|> Why??

The point is that if you haven't got a second drive, the message "INSERT
DISK B IN DRIVE A" will occur, otherwise it will be highly difficult to copy
disks with the DESKTOP. So you DO have two LOGICAL drives A: and B:
There's another system variable (sorry, don't know) which tells you how
many PHYSICAL floppies there are connected.

|> Is there a better way of checking for the existance of drive B:??

Besides that it's always better to use the GEMDOS function "getdrv" and
"setdrv" to determine the existing drives, because these ones use a 32 bit
vector, the xbios only 16 bits. So under MiNT you won't be able to check
for the drive U:

6387. The Unnkulian Unventures : Commerical Quality Text Adventures for FTP

Newsgroup: comp.sys.atari.st
Date: 1992-06-15 13:21:23 UTC
From: dmb@wam.umd.edu
Message-ID: <1992Jun15.132123.8252@wam.umd.edu>
Source record: 220883
Cross-posted to: rec.games.misc,comp.sys.mac.games,comp.sys.ibm.pc.games,comp.sys.ibm.pc.archives,comp.sys.ibm.pc.misc,
comp.sys.atari.st,rec.games.programmer,rec.arts.int-fiction

[Late-breaking news: Look for _Unnkulia 1/2: The Salesman Triumphant_
coming to an archive site near you, along with demos of _Unnkulia
Zero: The Search for Amanda_ and _The Legend Lives!_, the first
adventure in the science fiction Unnkulian Universe Unventure series.
Three exciting new Unnkulian games for you to fry your brain with!
What could be better?!]

The Unnkulian Unventure Series
Interactive Fiction for the 90's

Remember the good old days, when adventure games challenged you with
great puzzles and evocative descriptions without resorting to using any
graphics at all? We really miss the emphasis on gameplay rather
than glitz, so we've decided to write our own adventure games along the
lines of the early games we liked so much.

If you're looking for top-quality interactive fiction comparable to
those classic 1980's commercial offerings, check out the Unnkulian
Unventure series of games, shareware text adventures available from an
archive site near you!

In _Unnkulian Underworld: The Unknown Unventure_ you play the part of
Kuulest's slave, and must recover the Orb of Studosity from the evil
Unnkulians. Kuulest, the old geezebag, has died and left you with
nothing to go on but a cryptic message about saving the planet. You'll
encounter amazing Acme products, the infamous Guardian, those witty
creatures known as Drolls, a giant beaver, and even the Dread Unnkulian
Warrior. <Gasp!>

In _Unnkulian Unventure II: The Secret of Acme_ your adventure
continues as you try to create some good press for yourself -- wouldn't
want to fade into anonymous obscurity, now would you? Along the way,
you'll find the answers to these compelling questions, and more:

o What happened to the Unnkulians?
o Why are Acme products so bad?
o What is this cheez stuff, really?

Plus, you'll get to explore Dawg Rock, a Duhdhist Retreat, Acme's
clandestine prototypes laboratory, and even pay a visit to Acme HQ.
And in the process, you may get turned into a small flightless bird.

The Unnkulian Unventure games have already gotten rave reviews from
numerous adventure game connoisseurs, so why not give them a try?

The games are available for FTP:

PC and compatibles:
---

msdos.archive.umich.edu:

msdos/games/textadv/unnkul12.arc
msdos/games/textadv/unnk2v20.zip

Mac:
---

mac.archive.umich.edu:

mac/games/adventure/unnkulian1.03.sit.hqx
mac/games/adventure/unnkuliantwo2.0.sit.hqx

Atari ST:
---

atari.archive.umich.edu:

atari/games/tads/unnkul12.arc
atari/games/tads/unnk2v20.arc

Amiga and Unix:

We get a lot of requests for Amiga and Unix versions of our
games. We'd love to have versions running on all the
major machines, but unfortunately converting our games
to other platforms is beyond our control since the games
were written with a system called TADS; TADS only runs
on PC's, Mac's, and Atari ST's. If you'd like to know
about plans to port TADS to other platforms (if there
are any such plans), you can send email to Mike Roberts,
principal author of TADS, at <73737.417@compuserve.com>.

He gets flooded with mail about this every time I post
this message, though, so please be kind and brief for
his sake.

Notes on where to obtain TADS itself are included below.

Both Unnkulian games are shareware ($10 registration fee for each) --
registering gets you maps and hint sheets from the authors. Support us
and you'll continue to see fun text adventures like these.

Questions and comments are welcome!

Dave Baggett
dmb@wam.umd.edu

Appendix A

Where to get TADS via FTP:

TADS is available for the PC, Mac, and Atari ST, from the following sites:

msdos.archive.umich.edu: msdos/games/textadv/tads.zip
atari.archive.umich.edu: atari/games/tads/tads.lzh
mac.archive.umich.edu: mac/games/games.utilities/tads1.04.cpt.hqx

TADS is also shareware, and we strongly encourage you to register if
you use it since we feel it is a powerful, innovative, and very inexpensive
development system that deserves to be paid for.

6388. Re: Drvmap()

>In article <1992Jun14.052650.27139@DIALix.oz.au> steveq@DIALix.oz.au (Steve Quartly) writes:

>>I am using the Drvmap command in 'C' to determine if drive B: is connected..

> Drvmap reports the existance of drive B: because the internal drive can
> act as drive A: and B: providing "virtual-disking".

True. In fact, Drvmap() returns the system variable _drvbits; there is another variable, _nflops, that tells you how many floppies are connected.
Note that these things can only be read (and written) in super mode.
Here's a routine that reads _nflops:

```
int Nflops(void)
{
long stack;
int _nflops;

stack = Super(0L);
_nflops = (*((int *)0x4A6L));
Super((void *)stack);
return(_nflops);
}
```

Hope this helps, Jeroen.

6389. Re: Falcon Status

Newsgroup: comp.sys.atari.st
Date: 1992-06-15 14:45:24 UTC
From: saj@chinet.chi.il.us
Message-ID: <1992Jun15.144524.27724@chinet.chi.il.us>
Source record: 220809

Bob Brodie said a couple of things about the 'Falcon' quietly at the Milwaukee Atari Fest. He endorsed anything Leonard Tramiel has said about it (other Tramiels have to stand on their own credibility) and said that it is on or ahead of schedule for the release date they wanted.

Under some pressure, he said that he's probably the only 'official Atari spokesperson' for general announcements in the English-speaking countries.

Commercial deliveries should happen in Europe before the US, but not by any huge margin.
Steve saj@chinet.chi.il.us

: >>So the FALCON is a replacer for the current lower STEs? and perhaps the
: >>Mega STEs?
: >
: >I've heard that when the Falcon is released, both STe and Mega STe
: >will be withdrawn from the markets.
:
: This is clearly cr*p because a 520STe's RRP is currently #280 in england
: and the Falcon is predicted to cost #600 which is bound to be an under
: estimate. The Falcon is aimed at a totally different market.
: As for the Mega STe, this has a separate keyboard and is aimed more at
: the serious market. However, it is very overpriced at the moment and is
: going look alot more overpriced if/when the Falcon comes out.
: I think the TT is most likely to be discontinued, if the Falcon 040 with
: separate keyboard rumours are true.
:
: - Leo Hendry

Yep. If not for desktop publishing, I wouldn't see an application for the
TT at all. If You need < Insert student's standard wishlist here >, which includes
Unix, X-Window, *good* graphics & sound, SCSI; the average person
would choose an '486. The 68030 ist *just too slow*. (look at the Next030,
even the 040 is to replaced by an 88110).
I`ll be happy with my ST@16Mhz and Minix, thank You. (No X-Windows, right!)
Maybe the Falcon 040 will be worth a second look.

Tom

:DEV:
How do I become a developer for the Atari ST?
==========

Contact Gail Johnson, Atari Rep Person, (408)745-2568

[UNITED STATES ONLY. IF YOU LIVE OUTSIDE THE UNITED STATES, CONTACT
YOUR COUNTRY'S ATARI HEADQUARTERS FOR MORE INFORMATION.]

Gail can explain the program to you, and send an information packet if you
desire.

Atari has gone to a 2-tier developer membership. The 'higher quality'
developer support goes to commercial developers, and costs $250. The
'no-hand-holding, no announcement of company future products, no access
to discounted hardware' goes to noncommercial developers, at an initial cost
of $125, plus $50 renewal fee each year.

Both tiers receive the ST/TT Developer Kit and all developers have to fill
in an application form and a non-disclosure agreement. Contact Gail for
more information.

Atari is now selling the developer's kit (or parts of it) seperately. No
project-in-development or non-disclosure agreement is necessary.

:ERR:
What does TOS ERROR nn mean?
What do the bombs on my screen mean?
==========

The information below was written, in part, by Darryl May, and posted on
GEnie in January (of ????) by John Townsend. The original also appeared in
the June 1988 issue of _Current Notes_ (122 N. Johnson Rd., Sterling, VA
22170). It has since found its way to me, and is being posted to
comp.sys.atari.st as a service to readers.

Alan Pratt wrote to tell me that the basic information may be correct, but
that it cannot be dubbed "official" unless it originates, on paper, from
Atari. This makes sense, as electronic communications are easily
modified, even accidentally.

Roland Waldi provided information regarding the difference between TOS and
GEM return codes which appears to be correct. The tables have been modified
to reflect his information.

The following is an unofficial list of the errors that can appear
while you are operating your ST computer.

Error description return code alert box #
===
OK (no error).....................0
Fundamental error................-1
Drive not ready..................-2
Unknown command..................-3

What is Free-Net and how can I get access?
==========================================

A "Remodeled" Atari S.I.G. Opens

By now many of you have heard of the Cleveland Freenet, or more
specifically the Atari S.I.G. on the Cleveland Freenet. For those who
haven't, the Cleveland Freenet is an experimental computer system providing
free public community telecomputing. Basically, it's a lot like a public
library of the future. Many of these systems are popping up all over the
country. Don't be surprised if one pops up in your neighborhood in the
future.

Recently the Atari SIG has undergone a significant face-lift. All
the regular areas are intact including its news sections, user group
newsletter, online magazine sections, general as well as specific
computer discussion boards (8 bit, 16/32 bit, Lynx, Portfolio), and our
weekly Sunday night multi-chat conference.

The conference starts at 8pm EST sharp and is on channel
"+Ataricon". What the staff at the Atari SIG has added, has given the
Atari SIG the potential to cover all grounds of Atari and its related
products.
```

The most noticeable addition to the Atari SIG is the Programming and Development Forum. This forum is intended to be used by developers, professional programmers, and Atari hackers (the old definition of "hacker") as a means to share ideas, help each other out, and find out the latest technical information on Atari's products. This board is ran by newly acquired SIG Operator, Peter Haller, a professional programmer who is running developer sections on hardware and software development, programming, MIDI applications development, Graphics Design, plus many other sections that can definitely become a programmer and developer's dream come true!

Last, but definitely not least, the Atari SIG has a restructured Product Info and Support Board and a new Special Applications Board. The Support Board includes a vast library of support lists. These lists range anywhere from phone numbers of Atari dealers and producers, to software reviews for 8 bit, 16/32 bit, Lynx, and Portfolio software. To sum it all up this area covers what's out there, who makes it, and how to get it for all Atari products. The Special Applications Board is just starting out. Currently there is an area for users of MIDI on the ST. MIDI users are encouraged to use this as a means to discuss MIDI related topics. This section is expected to expand in the future.

Accessing the Atari SIG has never been easier. One can access it via Internet by telenet'ing to 129.22.8.75 or "Freenet-in-b.cwru.edu" or by calling (216) 368-3888 300/1200/2400 bps. Once on the system, a user can apply for an account application and logon as a visitor. Once here, simply type "Go Atari" to get to the Atari SIG. A visitor can go anywhere on the Freenet and can read anything. They can't post messages until they get their permanent accounts, however.

For additional information on obtaining access to Freenet write to myself via the e-mail addresses above or by writing the SIG at its US mail address:
The Atari SIG
P.O. Box 21815
Cleveland, OH 44121 USA

Lastly, a freenet application is available in the mail by writing a request to the above address if you rather not download it from Freenet.

The Atari SIG is ready to serve the thousands of Atarians throughout the world. We look forward to seeing you all real soon! Remember the staff of the Atari SIG are volunteering their time for no pay and the Cleveland Freenet, as well as the Atari S.I.G., is a non-profit organization existing for the free exchange of information.

:MAGS:
What magazines are available for the Atari ST?
==========

The information here is preliminary. If you've got updates, mini-reviews,
or more information on other magazines, please send them to me via e-mail.
As always, WRITE to a company before sending them money for a subscription.

US mags:

AtariUser, published by Quill Publishing Company

Cover Price: US $1.00 Canada $1.45 UK 1.50 (AtariUser is available for free
[$6.00/50 magazine shipping charge] from participating computer dealers,
bookstores & user groups!)

Subcription Rate: $21.30 US Bulkrate, $41.30 US First Class.
Address: AtariUser, 113 W. College Street, Covina, CA 91723 USA

Current Notes, published by Current Notes Inc.

Cover Price: US $3.95

Subscription Rate: $27.00/year (Atari clubs registered with Current Notes may
subscribe at $23.00/year) US, $35.00/year (Canadian club members at $31/year)
Canadian, Foreign rate $44/year.

Address: Current Notes Inc., 122 N. Johnson Rd., Sterling, VA 22170 USA

Atari Interface:

Write for a free sample copy of the Atari Interface magazine
(Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108)

AIM is soon to be available in Canada, Europe and Mexico, and should be in
all local WaldenSoftware stores and many bookstores. If your "local"
Atari dealer doesn't have it, he should be able to get it for you...

UK Mags:

ST Applications:
---

formerly the ST Club Newsletter, this is now the only
non-games mag in the UK (although see ST World below). Approx. 4,500
copies per issue sold. News, reviews, interviews, tech tips, general
forum, programmers' forum, PD catalogue. DTP'd on an ST. Retains a
'user-driven' feel. Recommended. The associated ST Club runs a PD
distribution service and distributes a couple of commercial programs too
(Fontkit Plus, UIS III, Molgraph, CRL Virus Killer, etc.).

Subscription costs: UK - 15 pounds; Europe - 18 pounds (Air Mail);
worldwide - 28 pounds (Air Mail)

Address: ST Club, 49 Stoney Street, Nottingham, NG1 1LX ENGLAND

ST World:
---

formerly the leading UK non-games mag. Became a quarterly 'buyer's guide' in Autumn 90. Now, allegedly, about to be revived as a monthly (under the stewardship of Jean Gollner, mother of ex-editor Hugh) in the wake of Atari UK's new push into the 'serious' market.

ST Format:
---

all-purpose 150-page monthly, mainly aimed at young people. Lively, but of uneven quality. Big leisure section, but other areas covered too. Includes cover disk - mix of games demos and (usually out of date) PD utilities. Probably the biggest-selling UK ST mag. Has had several public rows with Atari UK.

Atari ST User:
---

like ST Format. Generally (amongst online users) thought to be not quite as good.

ST Action:
---

games, games and more games. And games.

There are ST sections in New Computer Express (weekly), Computer Shopper (monthly) and some general-purpose games mags whose names I forget.

There are also, I think, some MIDI mags with strong ST content. I don't have their names.

German Mags:

Atari PD Journal:

Reviewed in the May '91 issue of Current Notes [from which I'm cribbing this information, DP-Z]. Hardware and Software reviews, some commercial software reviewed. Typical issue runs around 90 pages. Special "Katalog" section.

Subscription: DM 70 (normal mail), DM 100 (air mail). Prices may be for domestic distribution -- write first!

Address: Heim Verlag, PD Abonnement, Heidleberger Landstrasse 194, 6100 Darmstadt 13 GERMANY

ST-Magazin (formerly 68000er):

(monthly) Typical issue: around 150 pages. Includes DTP-magazine CICERO.

Subscription: DM 77 (domestic distribution); foreign - write for information

Address: ST-Magazin, Markt & Technik Verlag AG, Hans-Pinsel-Strasse 2,
D-8013 Haar bei Muenchen GERMANY

ST Computer:
---

11 issues/year, typical around 180 pages

Subscription: DM 80 (domestic), DM 100 (normal mail), DM 130 (air mail)

Address: Heim Verlag, Heidelberger Landstr. 194, D-6100 Darmstadt 13 GERMANY

:TIPS:
TIPS AND HINTS from other users
==========

Any 'multisync' monitor which handles 70 video fields a second can be used with the ST; the custom cable involves no tricks, or commercial ones are available. The original NEC multisync does NOT handle 70 fields a sec.

More than 3 bombs often means more than 1 error, so interpretations are tricky.

An ST-formatted disk which is not readable by a PC can be made readable by putting the 3 bytes EB 34 90 (those were 3 bytes of hex) at the beginning of the boot sector (sector 1 of track 0, I believe). This can be done with either an ST or PC absolute sector editor. The Desktop of TOS 1.4 and higher does this automatically. Note that the only format of disk that will work between both the PC and ST is 9 sectors, 80 tracks.

Some (older) PC-3.5"-drives cannot deal with the short track-header produced by ST formatters. On those drives, ST-formatted disks are not readable, independent of their boot sector contents. The other way, however, does always work: format on the PC.

When using disks formatted on a PC in an ST, make sure to insert and access a disk with a different serial number in between disk changes.

For those with the 'inaccessible' mouse and joystick ports, a joystick extender cable will make life easier. The Y-cable joystick extenders make it extremely easy to keep mouse and joystick connected to port 0, and a joystick extender cable in port 1 makes for easy hookup after you've moved the machine.

BARREL is a program which can redirect printer-data to a file. It comes in handy when your printer is unavailable, and the program does not already have an option to 'print-to-a-file'. (It is available on the atari.archive server.)

DBLEFEAT is a program which can redirect disk access from, say, drive A to drive B. Handy when a program 'hard-codes' the data drive, and you wish to use your hard drive instead. (It is available on the atari.archive server.)

On the Desktop of TOS 1.4 or higher, holding the right mouse button allows you to manipulate files in other windows. This is useful for a number

of reasons. An example is this: say D:\BLAH.ARC is a file you would
like to extract to D:\, but ARC.TTP is on C:\. Top D:\'s window, then
hold the right button while double-clicking ARC.TTP in an inactive window.

:ZNET:
Where can I get copies of ZNET?
==========

ZNET on-line magazine is available on CompuServe and GEnie. You can also get
copies mailed to you by sending an e-mail message to

stzmagazine-request@virginia.edu

indicating you wish to subscribe.

They won't get to you on Friday (which is when they're posted), but Greg
Lindahl provides an excellent service to the networking community by sending
these out.

ZNET and some information from the Current Notes user magazine are also
available from the atari.archive server under /atari/magazines.

:PD:
Where can I get Public Domain/Shareware software?
==========

There are FTP sources and a comp.sources.atari.st/comp.binaries.atari.st
mail server. You can also try the commercial on-line services such as
GEnie, CompuServe, Delphi and Bix.

Using FTP, most files should be retrieved in BINARY format (at least those
ending with the suffix of .ARC, .LZH, .ZOO, .PRG, .TTP, .TOS)

Mail servers encode files. You will need a program called 'uudecode' in
order to change files ending with the suffix .UUE (or .UAB, .UAC, etc.)
into their original form.

:MAIL:
E-Mail file servers

archive-server@twitterpater.Eng.Sun.COM:

Twitterpater holds all of the comp.sources.atari.st / comp.binaries.atari.st
postings. If you aren't reading these two newsgroups, you should consider
doing so. You may obtain uuencoded files as e-mail. You can obtain a
help file by mailing a message to archive-server@twitterpater.eng.sun.com, with
the main body of the message being the word 'help'.

atari@atari.archive.umich.edu:

The atari.archive server is mentioned many times in this article. It contains
a multitude of Atari ST PD and shareware programs. If you don't have access
via FTP you can obtain many of the files via e-mail. You should first obtain a

help file by mailing a message to atari@atari.archive.umich.edu, with the main body of the message being the word 'help.'. If you are from a uucp site, please enclose this statement also 'path host1!host2!....', where host1!host2!... is your path. Please read the help file completely before you ask questions, and then send any you may have to jon@atari.archive.umich.edu. Any questions about the archive or specific files go to weiner@atari.archive.umich.edu

archive-server@lancs.pdsoft:

This is a UK public domain archive, available to sites within the UK via via JANET.

info-server@ftp.Informatik.Uni-dortmund.DE:

This is a german public domain archive.

mail-server@cs.ruu.nl (or uunet!mcsun!hp4nl!ruuinf!mail-server):
---
send the following message

begin
path john@highbrow.edu (PLEASE SUBSTITUTE *YOUR* ADDRESS)
send ATARI-ST/index
end

NOTE: *** PLEASE USE VALID INTERNET ADDRESSES IF POSSIBLE. DO NOT USE ADDRESSES WITH ! and @ MIXED !!!! BITNETTERS USE USER@HOST.BITNET ***

The path command can be deleted if we receive a valid from address in your message. If this is the first time you use our mail server, we suggest you first issue the request:
send HELP

LISTSERV@UOGUELPH.BITNET:

Mail messages with the contents HELP will bring you some usage information and GET PROG-A16 FILELIST will provide you with a list of files. Subscriptions to INFO-A16 are also available on this server. INFO-A16 is a digest of messages from comp.sys.atari.st.

:FTP:
Anonymous FTP servers

Note: The generally accepted practice for FTP use is as follows:

1. Limit access times to non-working hours. This is usually 6-8 pm to 8-9 am LOCAL time. LOCAL time means local to the computer you are accessing! For example, 4 P.M. in Minneapolis, Minnesota is 10 P.M. in England, and 10 A.M. in Germany is 4 A.M. in New York.

2. Once you connect, issue the following commands at your FTP
prompt:

user anonymous
<YOUR e-mail address should be entered at the Password: prompt)
ls
cd <to the appropriate directory>

3. Limit downloads, especially across the ocean. Remember, there are
other people who are using the same lines as you.

Atari FTP sites (the list is -not- exhaustive)
----

atari.archive.umich.edu [141.211.164.8]

uk.ac.lancs.pdsoft (available to UK users via JANET)

Note: Access is a bit different for this archive site, use the following:

user pdsoft
pdsoft (at the Password prompt)

ftp.Informatik.Uni-dortmund.DE [129.217.64.63]

cs.uni-sb.de [134.96.7.254]

archive.cs.ruu.nl [131.211.80.5]

==========
Hope you liked the comp.sys.atari.st FAQ. If you have comments,
suggestions, more material, etc., mail me at sourada@iastate.edu

Thanks to David Paschall-Zimbel (davidli@simvax.labmed.umn.edu) for
compiling most of this FAQ.

MAIL E-Mail file servers
FTP Anonymous FTP servers
TEX Is TeX/LaTeX available on the Atari ST?

:WEL:
Welcome to comp.sys.atari.st
============================

This newsgroup is devoted to discussion about 16 and 32 bit Atari micros. At
present that includes the Atari 520ST, 1040ST, Mega ST, STe, STacy, Mega STe,
and the Atari TT. There are also emulators for the Apple Macintosh and IBM
PC/XT/AT available.

Most of the people who read this newsgroup are technically oriented.
The newsgroup serves as a resource for Atari users ... feel free to
contribute to the discussions.

Associated newsgroups include:

comp.binaries.atari.st ! uuencoded binary programs
comp.sys.atari.st.tech ! technical programming/hardware topics
comp.sources.atari.st ! uuencoded/shar sources
```

:ARCS:
How do I deal with Archived files (.ZOO, .ARC, .LZH)?
==========

Files ending with suffixes .ZOO, .ARC and .LZH are archive files. They are binary files which may contain one or more other files in a compressed format. Archive files usually take up less disk space, and for this reason have become quite popular for transferring large files via modem.

In order to extract the files from an archive file, one must use an archive program. Here are the correspondences:

ARC Use ARC.TTP
LZH Use LHARC.TTP
ZOO Use ZOO.TTP

ARCHIVERS
These programs are all available via FTP from the atari.archive server, in the /atari/archivers directory. Recommended files are:

arc602.ttp - version 6.02 of ARC, includes features to archive subdirectories and also include comments with files.

arc602.arc - contains documentation. UnArc using arc602.ttp.

arc521e.arc - older version of ARC. Used mostly by those who want speed, better compression, and don't care about archiving subdirectories. UnArc using arc602.ttp.

lharc.ttp - version 2.0 of LHARC.

lzh201i.lzh - Thomas Questors lzh utility. German documentation. UnArc using lharc.ttp

zoo21.ttp - version 2.1 of ZOO

zoo21bin.zoo - ZOO archive includes documentation. UnArc using zoo21.ttp.

:CLI:
What Command Line Interpreters are available?
==========

There are a large number of Command Line Interpreters for the Atari ST. Some of the more popular ones include:

gulam the 'classic' cli, somewhat UNIX in flavor

BASH GNU Bourne Again Shell - available under MINT

ksh Korn Shell - available under MINT

gemini MUPFEL is the shell used by the gemini environment

okami a German shell with many useful utilities built in

pcommand an MS-DOS-like shell

csh C-shell, standard on Unix

tcsh Enchanced C-shell - available under MiNT

Check atari.archive under /atari/cli or /atari/mint, or check one of the other FTP sites for files.

:ERR:
What does TOS ERROR nn mean?
What do the bombs on my screen mean?
==========

The information below was written, in part, by Darryl May, and posted on GEnie in January (of ????) by John Townsend. The original also appeared in the June 1988 issue of _Current Notes_ (122 N. Johnson Rd., Sterling, VA 22170). It has since found its way to me, and is being posted to comp.sys.atari.st as a service to readers.

Alan Pratt wrote to tell me that the basic information may be correct, but that it cannot be dubbed "official" unless it originates, on paper, from Atari. This makes sense, as electronic communications are easily modified, even accidentally.

Roland Waldi provided information regarding the difference between TOS and GEM return codes which appears to be correct. The tables have been modified to reflect his information.

The following is an unofficial list of the errors that can appear while you are operating your ST computer.

Error description return code alert box #
==========
OK (no error).....0
Fundamental error.....-1
Drive not ready.....-2
Unknown command.....-3
CRC error.....-4
Bad request.....-5
Seek error.....-6
Unknown media.....-7
Sector not found.....-8
No paper.....-9
Write fault.....-10
Read fault.....-11
General error.....-12
Write protect.....-13
Media change.....-14
Unknown device.....-15
Bad sectors on format.....-16
Insert other disk.....-17
Invalid function number.....-32.....1
File not found.....-33.....2
Path not found.....-34.....3
No handles left.....-35.....4

```
Access denied..................-36.............5
Invalid handle.................-37.............6
Insufficient memory............-39.............8
Invalid memory block address...-40.............9
Invalid drive specified........-46............15

No more files..................-49............18
Range error....................-64............33
Internal error.................-65............34
Invalid program load format....-66............35

The last code is the infamous "TOS error 35"!

Also, some unofficial information via Alan Pratt:

Notably, you should add -48: ENSAME (not the same drive, occurs when
you call Frename and the two names you give aren't on the same drive),
and -67: EGSBF: you can't use Mshrink to GROW a block of memory.

Those bombs that appear on your screen are error messages from
the 68000 micro-processor.

Number
Description of bombs

Trap Instruction Vectors.....32-47
[unassigned, reserved].......48-63
User Interrupt Vectors......64-255
```

:GDOS:
What is GDOS, and where can I get it?
====================================

GDOS stands for Graphic Device Output System (at least that's what my copy of STart, volume 1 number 1 said...)

There is a newer version, called FSMGDOS, which should be available commercially from Atari. It is currently included with WordFlair II. FSMGDOS uses scaleable fonts - you do not need to create a font file for every point size. Current word is that the street price for FSMGDOS will be about $50. The Lucida font family comes with FSMGDOS, and the output is very nice, even on a 9-pin Epson printer. There are desk accessories which allow you to manipulate available fonts, and also CPX programs for the newer Atari Control Panel. For those who only have limited memory, a newer version of GDOS is also included with the distribution. For those with investments in older bit-mapped GDOS fonts, they may be used with the new version of GDOS or used as bit-mapped (ie. non-scaleable) fonts within FSMGDOS.

You can get a copy of "Everything You Ever Wanted to Know About GDOS (and more)" by Douglas N. Wheeler from the atari.archive server. The file is /atari/programming/gdos.arc.

There is a German version of GDOS available from the atari.archive server. The file is /atari/utilities/amcgdos.arc.

Currently, there are no truly public domain sources for the GDOS system files or font files (at least those supplied by Atari). You can get these files with many commercial programs, such as Degas Elite, WordFlair, etc. You might also want to check your local user group to see if they received a copy of the WordFlair demo program (also available on GEnie). The demo program appears to have the GDOS system and font files.

:GNU:
What GNU software is available for the ST?
===

The Free Software Foundation C compiler, commonly known as GNU C (or gcc) is avaiable for the Atari ST. The minimal memory required to do any useful (i.e. beyond 'hello world') programming is 2.5 megabytes. A 4 megabyte system is recommended.

There is an extensive archive of the latest GNU C programs via anonymous FTP on atari.archive. GNU C is also available at cs.uni-sb.de and most other European FTP sites. The latest version of GCC available for the ST is 2.1, this version includes built-in support for C++.

The following can be found in the /atari/gnustuff/tos directory of atari.archive: (Note: all of these have Unixmode and MiNT support)

BASH Bourne-again shell
BISON Yet another YACC (Yet Another Compiler Compiler)
COMPRESS Compatible with Unix compress
DIFF Compares files; PATCH does the inverse

EMACS Extreme editor :-)
Fileutils Unix file utilities
FLEX Lexical analyzer, like Unix lex
GAWK AWK report generation language
GCC 2.1 C, C++ compiler
GDB GNU debugger, with source level C support
Ghostscript Postscript clone
GROFF Text formatting system
GREP Regular expression search, like Unix grep
MAKE Like Unix make
MAKEINFO Stand-alone system to process .info files
PATCH Changes files from diffs; DIFF does the inverse
PROF Profiles executable code
RCS Revision Control System
SED Stream editor
Smalltalk Smalltalk; object oriented language
TAR Tape archiver like Unix tar

:HAM:
Where can I find Ham Radio software for the ST?
==========

Plenty of Ham Radio software is available for the Atari ST:

Morse code
Radio Teletype (RTTY)
Packet Radio (W0RLI BBS and K9AQ TCP/IP)
Satellite Tracking
WEFAX
Color Slow Scan TV (SSTV)
etc.

For more information contact the Atari Microcomputer Network:

Newsletter Editor - Gil Frederick, VE4AG
130 Maureen Street
Winnipeg, Manitoba
R3K 1M2 Canada
or
Program Librarian - John Adams, KC5FW
17106 Happy Hollow
San Antonio, TX 78232
U.S.A.
or
Tune into the weekly net Sundays 16:00 UTC on 14.325 MHz.

73,
John Langner, WB2OSZ

:LANG:
Public Domain/Shareware languages...
==========

There are a large number of programming languages available for use with the Atari ST. Programmers seem to flock to the Atari ST, and if you know of a language, you can probably find it, or an equivalent, for the ST.

68000 assembler/disassembler
abc
APL
AWK
BASIC
C
C++
cross assemblers (z80, 6502, 68xx,8031/80xx)
Elan
FORTRAN
FORTH
ICON
LISP
Modula2
OPS5
perl
PROLOG
SCHEME
Smalltalk
XLisp
XProlog
XScheme

Check the atari.archive server under /atari/languages. Most other archive sites will have a language directory which you can also check.

:MINIX:
Is MINIX available on the Atari ST?
==========

MINIX is a UNIX-like operating system for the IBM PC, XT, AT, 386, and PS/2, as well as the Apple Macintosh, Commodore Amiga, Atari ST, and later in 1991, Sun SPARC. It is available with all the source code for the entire operating system, the libraries, and nearly 200 UNIX-like utilities.

Demonstration disks for the IBM PC line and Atari ST are available for free via anonymous FTP for people on the Internet. A Macintosh version will be online soon. (If you can't wait, see below.)

To get a free demo disk and the manual, use ftp to connect to ftp.cs.vu.nl (192.31.231.42) and look in pub/minix/demo. The READ_ME file describes the contents of the directory and how to use it. Be sure to fetch and read this first. It contains important information.

If you don't have FTP access, you can buy the demo disk package from Prentice-Hall for $10 by calling (201) 767-5969 or FAX (201) 767-5625. Please DON'T ask me to send it by email. I have quite enough work already thank you. The ordering numbers for Prentice-Hall are:

- MINIX 1.5 IBM demo disk (0-13-582768-x) (in stock now)
- MINIX 1.5 Atari demo disk (0-13-582792-2) (in stock now)
- MINIX 1.5 Macintosh demo disk (0-13-582784-1) (in stock now)

Please note that although the demo disks are available for free on line, MINIX itself is copyrighted software and is not available on line. The demo disks are also copyrighted, but permission is hereby granted to upload and use them for evaluation purposes. The READ_ME file tells how MINIX can be ordered.

AS A COURTESY TO US, PLEASE DO NOT FTP DURING BUSINESS HOURS (EUROPEAN TIME). PLEASE FTP AFTER 11 A.M. EASTERN STANDARD TIME.

If you want to follow the MINIX discussion, read the comp.os.minix newsgroup, which is quite active and has almost 50,000 subscribers.

Have fun!

Andy Tanenbaum (ast@cs.vu.nl)

:MINT:
What is MiNT?
=============
MiNT is a free multitasking operating system extension for TOS. It is somewhat like BSD Unix from the programmer's perspective. Note that MiNT will only multitask character-based programs, GEM can't handle multiple programs and MiNT provides no enhancements to GEM. MiNT and lots of stuff to go with it can be found at atari.archive.umich.edu:/atari/mint.

A somewhat interesting note: MiNT is now the kernel of Atari's multitasking OS, MultiTOS. Originially MiNT stood for 'MiNT is Not TOS', but it's now 'MiNT is Now TOS'. :-)

:PAINT:
What is the format for [x] paint program data?
==

There is a periodic posting of ST Picture Formats, edited by David Baggett. The file is on the atari.archive server under /atari/graphics/picfmts.doc.

:PD:
Where can I get Public Domain/Shareware software?
===

There are FTP sources and a comp.sources.atari.st/comp.binaries.atari.st mail server. You can also try the commercial on-line services such as GEnie, CompuServe, Delphi and Bix.

Using FTP, most files should be retrieved in BINARY format (at least those ending with the suffix of .ARC, .LZH, .ZOO, .PRG, .TTP, .TOS)

Mail servers encode files. You will need a program called 'uudecode' in order to change files ending with the suffix .UUE (or .UAB, .UAC, etc.) into their original form.

E-Mail file servers

archive-server@twitterpater.Eng.Sun.COM:

Twitterpater holds all of the comp.sources.atari.st / comp.binaries.atari.st
postings. If you aren't reading these two newsgroups, you should consider
doing so. You may obtain uuencoded files as e-mail. You can obtain a
help file by mailing a message to archive-server@twitterpater.eng.sun.com, with
the main body of the message being the word 'help'.

atari@atari.archive.umich.edu:

The atari.archive server is mentioned many times in this article. It contains
a multitude of Atari ST PD and shareware programs. If you don't have access
via FTP you can obtain many of the files via e-mail. You should first obtain a
help file by mailing a message to atari@atari.archive.umich.edu, with the main
body of the message being the word 'help.'. If you are from a uucp site,
please enclose this statement also 'path host1!host2!....', where
host1!host2!... is your path. Please read the help file completely before you
ask questions, and then send any you may have to jon@atari.archive.umich.edu.
Any questions about the archive or specific files go to
weiner@atari.archive.umich.edu

archive-server@lancs.pdsoft:

This is a UK public domain archive, available to sites within the UK via
via JANET.

info-server@ftp.Informatik.Uni-dortmund.DE:

This is a german public domain archive.

mail-server@cs.ruu.nl (or uunet!mcsun!hp4nl!ruuinf!mail-server):
---
send the following message

begin
path john@highbrow.edu (PLEASE SUBSTITUTE *YOUR* ADDRESS)
send ATARI-ST/index
end

NOTE: *** PLEASE USE VALID INTERNET ADDRESSES IF POSSIBLE. DO NOT USE
ADDRESSES WITH ! and @ MIXED !!!! BITNETTERS USE USER@HOST.BITNET ***

The path command can be deleted if we receive a valid from address in your
message. If this is the first time you use our mail server, we suggest you
first issue the request:
send HELP

LISTSERV@UOGUELPH.BITNET:

Mail messages with the contents HELP will bring you some usage information
and GET PROG-A16 FILELIST will provide you with a list of files. Subscriptions
to INFO-A16 are also available on this server. INFO-A16 is a digest of
messages from comp.sys.atari.st.

:FTP:
Anonymous FTP servers

Note: The generally accepted practice for FTP use is as follows:

1. Limit access times to non-working hours. This is usually 6-8 pm
to 8-9 am LOCAL time. LOCAL time means local to the computer
you are accessing! For example, 4 P.M. in Minneapolis, Minnesota
is 10 P.M. in England, and 10 A.M. in Germany is 4 A.M. in New
York.

2. Once you connect, issue the following commands at your FTP
prompt:

user anonymous
<YOUR e-mail address should be entered at the Password: prompt)
ls
cd <to the appropriate directory>

3. Limit downloads, especially across the ocean. Remember, there are
other people who are using the same lines as you.

Atari FTP sites (the list is -not- exhaustive)
---

atari.archive.umich.edu [141.211.164.8]

uk.ac.lancs.pdsoft (available to UK users via JANET)

Note: Access is a bit different for this archive site, use the following:

user pdsoft
pdsoft (at the Password prompt)

ftp.Informatik.Uni-dortmund.DE [129.217.64.63]

cs.uni-sb.de [134.96.7.254]

archive.cs.ruu.nl [131.211.80.5]

:TEX:
Is TeX/LaTeX available on the Atari ST?
==========

The TeX/LaTeX typesetting programs are available on the Atari ST. Check the
atari.archive server under /atari/tex. Fonts and device drivers
(including one for the Epson 9-pin printers) are available on the
atari.archive server.

The latest version of TeX (3.1) has recently been made available on the atari.archive server. The files are in a subdirectory of their own.

Graham Higgins recently wrote a message in comp.sys.atari.st indicating the minimum files needed to get a working TeX/LaTeX system up and running on the Atari ST. He said:

You'll need, at minimum:

The binaries for LaTeX/TeX :StTeXBin
The style files :StTeXSty
The font macros :StTeXTfm

If you want to screen-preview, you'll need screen font files (showdvi)
If you want to print locally, you'll need printer font files (dvifont)

Allow 5Mb.

For a step-by-step article on setting up Tex and LaTeX, send an e-mail request to davidli@simvax.labmed.umn.edu. Be sure to mention 'tex.setup'.

There is also a complete, ready-to-install distribution called CS-TeX. The latest version, 4.0, is available at atari.archive: /atari/tex/cs-tex-4.0. This consists of 8 disks full of TeX stuff, plus an installation program that takes care of the details for you.

Welcome to comp.sys.atari.st
============================

This newsgroup is devoted to discussion about 16 and 32 bit Atari micros. At
present that includes the Atari 520ST, 1040ST, Mega ST, STe, STacy, Mega STe,
and the Atari TT. There are also emulators for the Apple Macintosh and IBM
PC/XT/AT available.

Most of the people who read this newsgroup are technically oriented.
The newsgroup serves as a resource for Atari users ... feel free to
contribute to the discussions.

Associated newsgroups include:

comp.binaries.atari.st ! uuencoded binary programs
comp.sys.atari.st.tech ! technical programming/hardware topics
comp.sources.atari.st ! uuencoded/shar sources

:ACCEL:
Hardware Accelerators
=====================

<This area under construction. Useful articles would be appreciated>

:DRIVES:
What should I know about hard drives and the ST?
[Still under construction. Send me stuff!]

On older ST's (pre Mega-STe), the only harddrive port available is Atari's proprietary one. This means that you must either buy a drive from Atari, or get a SCSI interface and use a SCSI drive. ICD makes several flavors of SCSI interfaces. (ICD, Incorporated, 1220 Rock Street, Rockford IL 61101, (815)968-2228)

:FLOPPY:
Can I use 1.44 meg floppy disks?

1.4 megabyte floppy drives will soon be available from Atari for MegaSTe and TT machines. If you own an older Atari ST, there is a company which offers a $199 kit (including floppy) to install and use the drive. (I will supply the name next month, sorry...)

Note that Tos versions prior to 2.06 will not format a 1.4 meg floppy from the desktop.

:GRAPHIC:
How can I enjoy enhanced graphics on my ST?

For stock STs, JRI makes a chip which allows a 4096 color palette.
There is also a public domain enhancement that allows 32768 colors on older STs. This can be found as 32kcolor.lzh on some archives.

There are a number of graphics boards on the market. Here is a first pass at listing some of them. The information is based on postings by Ben Gilbert and Jari Lehto.

C32 board by Matrix Datensystem (Germany)
* 800x608, 256 colors
* all ST/TT models
* 256k, 512k and 1meg versions

C75Z board by Matrix Datensystem (Germany)
* 1024x768, 256 colors
* Mega ST or STe, TT VME Buss

(Matrix GmbH has over 15, maybe over 20 with all versions, different graphics boards available, from hobbyist to professional, from CAD to GenLock and digitizing.)

ISAC board by Dover Research Company (U.S.)
* 1024x768, 16 colors from palette of 4096
* makes hi-res look like ST low res, just with a huge window
* Mega ST buss
* Dover Research Co. (612) 492-3913

The Imagine by Wittich Computer GmbH (Germany)
* 1024x768, 256 colors

* Mega ST only

(Versions available for all ST/TT models. Several possible resolutions.
Reasonable price, but slow and not very compatible..)

Crazy Dots by TKR (Germany)
* 1024x768, 256 colors
* Mega ST only

(1280x800, 256 colors out of 16.7 million color palette. 1664x1200 for
both 16 color and monochrome. True color option available. Mega ST,
Mega STe and TT.)

reSOLUTION SuperVGA by GengTec (Germany)
* 8 resolutions, 320x200 through 1600x1200
* 16 colors without driver, 256 out of 256,000 with driver
* 1 mb RAM
* uses a standard VGA monitor
* Mega ST or regular ST
* available in U.S. from Rio Datel, 1-800-782-9110, (702) 454-700

(1024x768 is the highest resolution with 256 colors. Driver is called
Multicolor VGA option. Compatible with NVDI and Blitter. Multisync
monitor recommended.)

AlberTT
* like ISAC card, but specific for TT VME buss

MegaScreen
* 832x624 monochrome
* connects to MegaBus
* works with Spectre

Reflex
*1024x1024 with SM124 monitor
*2048x2048 possible with expansion
*usable with most big-screen displays

ODIN by Marvin AG (Switzerland)
* external expansion
* gives TT-resolutions to a regular ST

Cyrel
* RISC-based card
* extremely costly

Graphics cards for which information is sought:

OmniChrome board by Omnimon Peripherals

JRI GenLock

Atari/Lexicor 24 bit color card

Jari Lehto proposed the following recommendations:

Low budget SVGA - reSOLUTION
Professional high-end use Cyrel (or is it Cyrix?)
Hobby or semi-pro DTP Reflex
Hobby DTP MegaScreen
To obtain TT resolution ODIN

:JOY:
What joysticks work best with the Atari ST?

The Atari ST works with joysticks with a 'standard' D-Socket. IBM-style joysticks, Apple joysticks, and Nintendo joysticks will -not- work.

Some recommended joysticks:

Konix Navigator - "best .. if you want to use it for any length of time"
Gravis - "responsive ... great for games like MidiMaze"
WICO - "strong reed switches, hard plastic and metal components"
Atari - "FAR more controllable and responsive than other, more durable units"

:MODEM:
What modems work with the Atari ST?

Any external modem should work fine with the Atari ST-series of computers. You will need to purchase or build an RS-232 cable. Be sure the cable is capable of establishing DTR with your modem, as many telecommunications packages check the status of the DTR line. (Ask your local hardware guru if you don't know what DTR is...)

The ST can connect to modems at up to 19,200 baud. Practically, you will purchase either a 2400-baud or 9600-baud modem. The cost of 2400-baud modems has dropped so much in the past few years that you should not even consider a slower modem. Believe me, modem speeds under 2400-baud are going to seem SLOOOOOOW to you!

:MONITOR:
What should I know about monitors and the ST?

The monitor is your connection to the ST. Without a monitor, you're typing blind. (Unless, of course, you have an RF modulator on your ST and attach it to your TV set. This is discouraged, as the bandwidth and resolution are pretty terrible for anything other than arcade games.)

There are three monitor choices for those of us owning Atari ST/STe equipment:

1. Monochrome monitors - these include the venerable SM124, one of the sharpest monochrome monitors on the market. Street price is about $150, used monitors should run around $80-90. You can also purchase a 19" monochrome monitor. This gives you a 'big screen' to play around in, and is best for work with DTP and CAD systems. The price is a bit high at $1500+, and you'll need a plug-in board, which is generally set up for the Mega ST machine.

2. Color monitors - including the SC1224 in all of its incarnations (JVC and Goldstar being the primary vendors). The newer monitor, the SC1435, has a 14" screen and stereo sound.

3. Multisync monitors - these monitors provide monochrome and color access in one monitor. The street price is around $450, about $100 more than a standard Atari color monitor. You need to reset your computer to change resolutions. In many cases, a nice little switch box is provided (or you can build one) which does this for you. Examples of multisync monitors include the OMNIMON RAINBOW MONITOR.

There are any number of monitor choices for those owning Atari TT equipment, although they all boil down to 'multisync VGA'. There 14" color VGA monitor from Atari is quite nice, as is the 19" monochrome monitor. Any standard 14" multisync VGA monitor will do as well. Forget moving your SM124 or SC1224 monitor to your new system, the cabling and electronics is just not going to work.

:PCEM:
How can I turn my Atari ST into a PC emulator?
==========

<This area under construction. Useful articles would be appreciated>

:SPECTRE:
How can I turn my Atari ST into a Macintosh emulator?
==========

<This area under construction. Useful articles would be appreciated>

:UPGRADE:
Can/should I upgrade my ST?

The answer depends on the type of ST you currently have, and what you want to do in the future. Be aware that there are a large number of modifications one can perform on the venerable 1040ST, and that newer machines are coming down in cost so much that to obtain a certain feature it may be cheaper to purchase new than to upgrade.

1. Memory - most ST machines may be upgraded to 4 megabytes. The newer STe machines use either SIP or SIMM

2. TOS - for those still running TOS 1.0, now is the time to consider an upgrade. TOS 1.4 has been around for at least 2 years now, and is -much- faster (and safer) for those using hard drives. TOS 2.06 is available as a hardware upgrade to ST and MegaST machines for about $150 from CodeHead

6395. Re: Common Lisp

Newsgroup: comp.sys.atari.st
Date: 1992-06-15 15:52:35 UTC
From: david@ariel.yorku.ca
Message-ID: <1992Jun15.155235.960@newshub.ariel.yorku.ca>
Source record: 220897

In article <1992Jun12.143725@aifh.ed.ac.uk>, samm@aifh.ed.ac.uk (Sam Marshall) writes:
>> In article <3782.06.92@janhh.hanse.de>, jan@janhh.hanse.de (Jan Willamowius)
>> writes:
>> # Hi!
>> #
>> # I'm looking for a Common Lisp for the ST. The best I found so far is
>> # CLISP by Bruno Haible and Michael Stoll.
>> #
>> # Is anybody else using it, too ?

I've used it a tiny bit, but I'd need to buy more memory before serious use (I have 1M). There are various bits and pieces missing, like BIGNUMs and stuff like that (I think), but I don't remember exactly what. I do remember that none of it would seriously affect my code, nor most other peoples'. (I'd use it more, but it's only for my machine at home, and at work I have Harlequin LispWorks. In fact, I'm tempted to buy more memory just so I can use CLISP more, but 1. I'm cheap, 2. I may just give the ST to my kids, and buy a more powerful machine, not necessarily from Atari, sad to say. (flames to /dev/null))

>> # Is there another Common Lisp that conforms to the Standard as described
>> # by Guy Steele ? Maybe including CLOS ???

Not that I'm aware of. LeLisp isn't CL, but it's fairly useable, I've heard. LeLisp is commercial, CLISP is PD (?).

>> # Cheers,
>> # Jan
>> #
>>
>> You could look out for XLISP in the PD, but I doubt it'll be much better
>> as it's only semi-common lisp compatable. It also has an OO extension,
>> but not the CLOS one !

David Betz did a great job on XLISP, but it's best used as an introduction to LISP programming. It's missing a lot of CL functionality, like multiple value returns and defstructs (I hacked something which could be used as a work-around, but I'd rather not have). Over half of the standard CLtL functions are missing (many of which I can do without, but I think even things like FIND and WITH-OPEN-FILE were missing).

>> I've not heard of CLISP before, I'd be interested to hear more about it.
>>
>> Sam.

If you're interested in programming in CL, you should definitely get CLISP.
(And maybe more memory!)

- DF

6396. Decompressing the book...

Newsgroup: comp.sys.atari.st
Date: 1992-06-15 16:44:49 UTC
From: asdbf@acad2.alaska.edu
Message-ID: <1992Jun15.124449.1@acad2.alaska.edu>
Source record: 220892

Has anyone had problems decompressing and detaring the arp68k_b.tar.Z

ST programming book in a.a? When I attempt to decompress it I get 2 Bombs
(Bus error). I have decompressed uniterm sucessfully but not the book.
I have TOS 1.0 and 1 meg.

Thanks in advance -

Dan...

6397. Meta-FAQ

Newsgroup: comp.sys.atari.st
Date: 1992-06-15 17:37:12 UTC
From: sourada@iastate.edu
Message-ID: <sourada.708629832@vincent1.iastate.edu>
Source record: 220889

Well, as you can see, my first attempt at an FAQ has been posted. I would appreciate feedback to make sure I get this right, so if you have any problems with it, please tell me. I've made a few changes to the original format, mainly out of laziness, because this format allows me to automate the building of the FAQ.

Coming next issue:

Expanded coverage of 'under construction' areas!
Better credits!
'Companies mentioned' list!

:-)

6398. Re: Drvmap()

Newsgroup: comp.sys.atari.st
Date: 1992-06-15 17:57:40 UTC
From: bpat@cs.mcgill.ca
Message-ID: <1992Jun15.175740.24746@cs.mcgill.ca>
Source record: 220894

From my experience, the "virtual-drive B" exists only for GEM, not TOS !!!
So a .PRG or .APP program can do without worrying about it, but .TOS and
.TTP will use drive A: WITHOUT WARNING FOR DISK SWAP !!! So you get
a lot of data destruction. Drive A: will report a disk swap if you change
disk, but it will only affect dirve A: !!! So any other read or write on drive
B: will use the FAT and directory listing of the previous disk, and do it's
stuff on the new one. Deadly !!!

Patrick BETREMIEUX

6399. Wanted AHDI program

Newsgroup: comp.sys.atari.st
Date: 1992-06-15 18:37:31 UTC
From: H.Regan@bradford.ac.uk
Message-ID: <1992Jun15.183731.2083@bradford.ac.uk>
Source record: 220890

Hi,

can some kind soul please mail me in UUENCODED format
an up-to-date copy of AHDI?

The one I have is very old and does not understand SCSI
disks.

Is there a copy on any modem accesible United Kingdom PD Archive?

Please email me your replies,

Thanks

Helen Regan

6400. Re: The First ST Game: Sundog?

From: ken@isgtec.com
Message-ID: <2714@isgtec.isgtec.com>
Source record: 220898

In article <1992Jun12.134007.22347@wam.umd.edu> dmb@wam.umd.edu (David M. Baggett) writes:

> Sundog was incredibly good, but wasn't Hex (by Mark of the Unicorn) the
> first commercial ST game?

You're right, Hex predated Sundog, but I have a way out :-}. I did say
the first *major* commercial ST game. Compared to Sundog, Hex is definitely
minor :-}. Hmmm I have Hex too, think I'll dig it up and see if it still
runs. Another real oldie is Time Bandits, but not as old as the above.
There were probably a couple other simple games before Sundog, anyone remember?

>What is the matter with using zoo on UNIX? (I don't think there is a UNIX
>version of lzh though).

Nothing wrong with zoo on Un*x. I like it, both on unix and on ST.
It beats tar with compress. Yes there is an lzh for Un*x, but
the problem is that lzh is a moving target, and so it is not
compatible with all Atari versions.

>I'd say, if you have the money for a TT, get one now. If not, get one when
>you can, or get a Falcon if they're out by the time you get enough cash.

This seems like strange advice. Surely the best advice would be:

Wait. The TT will drop in price dramatically and/or become
obsolete with the Falcon. Sit on you cash for a while until
you're able to make an informed decision.

Maybe the TT will drop in price dramatically as dealers find
them hard to sell in the light of the Falcon.

Maybe the Falcon will use a 16MHz 68030, so the 32MHz TT will be better,
unless the better graphics of the Falcon is more important to you than
speed (eg. you more into computer art than compiling programs, or
raytracing).

Maybe the proposed Falcon 68040 model will be superior in performance
and price, and the TT will be a total dinosaur.

All sorts of horrible thoughts fill my mind.

The only thing I'm sure of is that an Amiga 300 is not the answer. I saw
one on the weekend. Nice and fast, and I think the desktop could be
configured to be nicer than GEM (though my friend's set-up was pretty
gross), but such WEAK graphics modes! No high-colour modes at all. Unless
you count HAM. Spam, spam, spam and blood.

Wasn't there a pretty reliable test of displaying Specturm Pics - and
in so doing, the screen would wrap and do all sorts of nasty things. Less
obviously, it produced noize when playing sound out of the DMA sound ports.
If this is incorrect, please correct me before I lead someone astray. Aside
from the chip numbers (that someone already posted) can think of any other
"obvious" signs of having the bad chips.

Of course, this is Atari, so it is still possible. However, I am of (hopefull/optimistic) opinion that this is a configuration similar to the TT's: namely a split ST/TT memory design, coupled with a soldered-on bank of memory. Ie: 2MBSTram (soldered on)+4MBSTram (expansion) + 8MB TTram (fast ram expansion). It would _really_ suck if Atari pulled the ol' return a bus-error for all memory accesses above X, where X is a rediculously low number (ala 4MB for the ST). It would be unlikely that this is the case if the Falcon has a VME port - the VME card would be addressing 16MB (more if they put in the 6U VME ports as promised in the hardware docs - "future designs will implement 6U" or something like that - of course we may not be in the "future" yet....). Well, we can hope can't we?

I was reading the (as of last week) latest Atari user and it stated
that you need at LEAST TOS2.06 to run the 1.44MB floppies correctly. In fact,
that is supposed to be part of the AJAX upgrade. If it isn't, go get a copy of
the June '92 Atari user and take it to whoever you bought the upgrade from.
Show them the article about the 1.44MB drives (like page 4 or 5 ish). You
should be able to get the new ROMs.

Source record: 220826

I think that shareware is (assuming it's a good program) like
communisim-It would work if eveyone played by the rules. As it is, I
think that it can be mildly successful if the program is useful to a
wide enough spectrum of users, but not if it's a game. Llamatron had the
advantage of being heavily hyped. Perhaps you should try to get Blox on
tthe coerdisk of ST format?
Bill

6413. Connecting more SCSI to Atari Host Adapter (again)

Newsgroup: comp.sys.atari.st
Date: 1992-06-16 04:19:29 UTC
From: avp@garfield.cs.mun.ca
Message-ID: <1992Jun16.041929.12994@cs.mun.ca>
Source record: 220761

I am trying to connect more than
1 SCSI device to the Mega STE's Host Adapter board. I was told
it was possible with AHDI 5.0 and some dip switch flipping on the
adapter board. Supposedly, one switch toggles multi drive enable/
disable and the other two are for SCSI ID offset. With 2 SCSI
drives connected with a 3 ended SCSI cable, and 1 set to ID 0 and
the other set to ID 1, the one at the end of the cable has the
resistor packs, neither has the parity jumper. I have tried all
8 combinations of the 3 dip switches and no luck. I have verified
that 2 of the switches adjust the SCSI offset. The other seems to
do nothing. I have tried both versions of SHDRIVR (alldrive and
regular) and nothing.

Please enlighten me.

I have noticed many jumpers on the motherboard of the Mega STE, maybe
one of these must be changed?
Near the back of the board, there are J290 and J291 and have a
jumper with 2 wires attached.
Near the back there are W401 and W402
Near the front, there are W201, W202, & W203
Also near front a bank of switches taped over, S701.

Are any of these relevant? Even if they are, could I find out what
they are for? It all seems very interesting to me. Also, there
are 2 empty sockets in the right hand side of the board.

Any info would be greatly appreciated.

> several hours for it to go through the text in the first place!?!)

No one said all shareware demos were well done! So this one's annoying.

> Fine. Just don't call it SHAREWARE. Call it DEMOWARE, or something similar.

Personally, I don't care what it's called. I've been using the term loosely
I suppose as something you pay for.

> working program for which, after an evaluation period, she could either pay
> the shareware fee or stop using the program.

This doesn't work.

> solution. It isn't shareware -- it's a demo of a program for which the
> programmer expects money before I can get a full working program, and then
> provides no recourse if I decide the program isn't worth the shareware fee
> after all.

A well-done demo would let you decide before you sent money. There are
good and bad demos.

> A) If it isn't a full working program it's not Shareware. It's a demo of a
> sub-commercial program.

If you insist. How about SCPD's, then?

> B) Commercial programs get reviewed in the Atari ST press, most sub-commercial
> programs are never reviewed.

Some on-line mags review SCPD's.

> C) Most of the methods authors of sub-commercial programs have used to
> 'cripple' their demos are
> 1) insulting
> 2) annoying

I agree that flashing messages saying "Buy me, Buy me" is very annoying,
but I mentioned better alternatives in an earlier post.

> Check out a commercial demo sometime. The people who produce them make every
> effort NOT to annoy or insult the person using the demo. The Arabesque demo,
> for example, doesn't put in 10-second delays after every action.

I have, several times, and they are often well-done. Just because it's a commercial demo doesn't mean it's good though. For example, the Sudden View demo I believe puts up stupid ad messages with time delays.

> I DO have problems with certain authors of 'crippled demos
> posing as Shareware' who expect me to have a favorable view of their program
> after looking at a menu bar, or who cripple their demos in such a way that I
> have no idea of the program's performance.

As I said, there are good ones and bad ones. Throw away the bad ones.
There are good ones based for example on limited functionality.
Just because there are lousy SCPD's doesn't mean they're all junk.

You probably should of also mentioned that the number of drives connected is stored at memory location $4a6 (_nflops) for those that _really_ need to know how many floppy drives are attached. TOS only allows for up to 2 external floppy drives, so the number there will have to be between 0 (you don't have to have a drive attached) and 2.

I think it's stored as a word there, but it's been a long time since I've looked at it.

This article says and I quote:

... a number of Mega STe computers have been found in dealer inventories
that have the new Ajax/1.44 meg drive installed, but are equipped with TOS
2.05 instead of 2.06. The latter is required to achieve IBM 1.44 meg
disk format compatibility. While Atari diss will work fine, a 2.05 formatted
1.44 disk will not read in an IBM. All other functions, including 'normal'
density disk interchangeability, are unaffected by the earlier TOS version.

I have one of these 2.05 ajax/1.44 MegaSTe's. I also recently did the
opwer supply fix. After performing the fix, my drive now formats at high
and normal density just fine. As the article says however, i can't take it
to an IBM at 1.44. Thus I just format all my 1.44 disks on an IBM, and

bring them back to the ST to use. Works just fine for me, and preserves
interchangeability for high density. When I bought the STe (last week) I
decided that the interchangeability was not worth the 60 dollars for the chips.
I know there were bug fixes, but until I actually have one that interferes,
I am happy with 2.05 for now.

PS. The dealer would not give 2.06 free if the Mega came with 2.05.

Hello,

I think one very good viruskiller is "VIRENDETEKTOR". This is a german
Shareware programm and the programmer support it realy good. You can
connect him per E-Mail if you have problems with some new virus in
the MausNet. The MausNet is connected with Usenet per gate and the
E-Mail-adress is: (name of User) @ (Box) .maus.de
But I think that the programm is only with german text avaible. The
newest Version is only about one or two weeks old!

If you are intressted by the adress of the programmwriter tell it to me.

Hope this help you. Bye __
/ h o m a s

P.S.: Sorry for my bad english and the mistakes in the Text

6419. To all porters of GNU software ...

Newsgroup: comp.sys.atari.st
Date: 1992-06-16 06:40:52 UTC
From: ASI503@DJUKFA11.BITNET
Message-ID: <92168.084052ASI503@DJUKFA11.BITNET>
Source record: 220812

This time I have one question and one little wish:

Q.: Will there be in the future a version of GDB that can debug C++ programs?

W.: For a beginner it is difficult to use the ported programs because not in all packages there is a documentation included. Of course, there is some documentation somewhere, but it's hard and time consuming to find it. So my wish is: Please include documentation as .texinfo file in every source or binary package.

This is no criticism, in fact I'd like to thank all of you very much for making available those programs to us Atari users !

Message-ID: <hm308ba.708679303@unidui>
Source record: 220814

Hi,
I am trying to setup TOMSHELL on a 1MB ST for use with GAWK, EMACS and some small batch files. Everything seems to work fine, but ...

- GAWK does not recognize the variables that were defined via tomshell's "set var data" in its ENVIRON[var] array. Is there another way to do so?

- I tried to add a few Unix-like commands from the unixtkit package, but tomshell refuses to launch them saying something like "Bad executable format", even when I renamed the files from PRG to TTP/TOS. What's going wrong?

- Changing a floppy in an external drive causes trouble. How can I tell tomshell about a media change in drive B: ?

Any hints greatly appreciated.
Thanks in advance

Wel the terminal program you use depends on what features you
need for the BBS's you call, and you own personal preferences.
One other program i'd include would be XYZ.TTP, it's gotta be
the best file transfer program around, most comms programs just
use it now anyway instead of using built in ones. Freeze dried term
is supplied with it.
There are also some good commercial programs available... one i'd
advise against is Mini Office Professional by Database software.
In comparason to the shareware stuff I use now, it was a BIG waste of
$90 !! :-(

Flash seems to be pretty popular, and Interlink.

Source record: 220821

I think that the only link-virus finder (killer?) is the "Ultimate Virus Killer" it's updated every 3 months (really!) and only costs 10 pounds, in the UK (and I think that updates are 5 pounds). It specializes on boot-sector virii (and can repair 500+ (?) game bootsectors) but can search HDs for 5 different (or more) link virii.

If you a stuck for more details mail me and I'll dig out there address etc.

Excuse me! The 68030 is approximately the same speed as the '486 at the same clock rate, the 68040 is about 1.5-2 times the speed of the '486. The main reason for the slowness of the original NeXT cube was the speed of its main storage device.. the read/write optical disks plus the speed at which the processor was running (25MHz I believe, though I could be wrong).

Have you ever used a Sun 3/60... that's got a lowly 68020 in it and it's a match for any '486 box in raw processing power. It's not the processor speed which is the bottle neck these days it's the peripherals and the internal architecture which determines the speed.

If i try to run an exe-file that is packed with PK-Lite, or run an file made with Turbo Pascal (With the special unit for the Portfolio), my Porrtfolio gives an Exec-error. I phoned Atari Benelux but nobody was able to answer the question why this error is given. On every Atari ftp-site or BBS Pklite can be found in the Portfolio directory so I assume that you can use that on the Portfolio. If someone can give a solution to this problem please e-mail me or put in on NN.

Thanx in advance,

Gerard.

>stuff on the new one. Deadly !!!

This happens only because the standard error handler used in GEM programs
cannot be fully used when running in text-only mode. So the disk change
message from the bios is is just thrown away. It's not a bios problem,
rather a feature/bug in the critical error handling.

Hi
I am trying to upgrade the disk drive in my TT from 720 K to
1.44 Meg. I have managed to get TOS 3.06, but the every helpfull
Atari UK are unable to supply me with the new disk controller
chip that is needed 'AJAX' I think.

Anybody know of a Source in Europe ??

Apart from replacing the drive, the floppy controller chip and
upgrading TOS to 3.06 what else must I do.

Thanks in advance

Andy

> Blurps, thats the Problem... :-(

That problem was fixed a long time ago. Just use a newer version of Mtools.
FYI, I used Mtools on a SparcStation a year ago, and all disks were perfectly
readable on my ST.

> compiler. Good prolog interpreters are prolog68 (I only have an
> experimental version) and Turbo Prolog (it's predecessor).

Prolog-68 is compiler-based, but generates intermediate code which is interpreted. So, even if it may not be a `true' compiler, it's definitely not an interpreter.
The predecessor of Prolog-68 was TOY Prolog ST, a port of TOY Prolog by Kluzniak & Szpakowicz. Turbo Prolog is something entirely different (it was the predecessor of PDC Prolog, on Messy-DOS machines).

There are several commercial Prologs, e.g. Maxon Prolog & MPROLOG. I never used any of them (being the author of the above, I didn't have to :-).

Wrong. Drvmap() is BIOS (not XBIOS) and _does_ return 32 bits. However,
it's true that you should call GEMDOS functions when you want to know
which GEMDOS devices exist (in this case: map = Dsetdrv (Dgetdrv());).

I have a TT at home and a 486 at work (not by choice) and I have found
the TT to be a bit slower, not much though. The main difference between the
two as far as I can tell is that the PC at work has 256K of external cache!
Whereas the TT has only it's 512K cache on board the cpu. It would be
interesting to be able to put the same amount of cache on my TT as is on
the PC and then compare them.

6439. Hard Disk Project

Newsgroup: comp.sys.atari.st
Date: 1992-06-16 12:43:47 UTC
From: ralph@laas.fr
Message-ID: <RALPH.92Jun16144347@orion.laas.fr>
Source record: 220843
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

I currently have an Atari SH204 disk attached to my Mega 4 ST. I have
been thinking about a do-it-yourself hard disk project since I have
access to some used hard drives. First of all, I would like to have
some more information on these drives, since they come with only a
defective sector list. They are:

1) Quantum Q540, series 05, 15-50470 rev. A, copy. Quantum 1984.
This disk apparently has 480 cyls, 8 heads, and 16 sectors/track.
The precompensation cyl. is 256 and the landing zone is 643.
Apparently, its unformatted size is 40 Mb and formatted it is 31.4
Mb and it's average access time is 45 ms. The interface is
ST412/ST506.

2) Fujitsu Part No. B03B-4805-B003A#N2, rev. B 9, date 1986-4
This disk comes from a Sun-3 shoebox so it might be a Fujitsu
M2243AS. The latter is 86 Mb raw, 70.8 Mb formatted.

I would very much appreciate information such as no. tracks/cyl., no.
cyls, and no. sectors/track, data transfer rate, mean access time,
interleaving, power consumption, etc. Also, what the various jumpers
on the card might signify.

The Fujitsu disk also comes with an Adaptec ACB-4000 controller. I
suppose that this would convert the disk's native format (ST506 I
believe) to SCSI.

I was thinking of putting both disks in an XT style case, together
with the Adaptec controller. Is the controller any good for an ST?
Can this controller handle two disks? Both seem to be ST506 drives.

What are the pitfalls of such a project?

Another solution would be to use the Fujitsu drive directly in my
SH204. I suppose that this might work quite easily. How much power
does an SH204 power supply actually supply? The Fujitsu's rating is
+12V, 22W and +5V, 8w.

Pleas reply by e-mail, if at all possible, and I'll summarize if
there's any interest in such a homebrew.

Thanks a lot folks.

Hi, it actually appears as though there might be a short circuit on the circuit
board/monitor socket. I haven't worked out how to fix it but the computer boots
in hi-res mode even on a 'cold boot' (without any disk).
A short circuit isn't obviously visible but this seems the only likely
explanation.

thanks,
adam whitham.

In article <1992Jun15.082707.6093@fel.tno.nl>, qb7g6@fel.tno.nl (Maarten Landzaat) writes:
%% Hi,
%% I'm trying to take control over my Roland Sound Canvas (SC-55) with
%% my Atari using Turbo C 2.0.
%%
%% For system exclusive MIDI messages, Roland requires the last byte to
%% be a checksum. Of course, I'd be glad to compute it and give to the
%% needing thing, but HOW? I don't know whether to add or xor, or which
%% bytes to take into account, I can't find anything. Trying it out
%% takes too long; on every wrong checksum, the canvas displays
%% "Check sum error!" for about 1.5 second.

The right checksum must clear the seven lowest order bits of the
sum of all the bytes in the message when added to it. The sum is
computed starting from the first byte of the "address" up to the
checksum byte, not included.

Example (GS-Reset message)

F0 41 10 42 12 40 00 7F 00 41 F7

---------- --
ID Checksum

Address

--
Value

The sum of the bytes in the message is 0x40 + 0x00 + 0x7F + 0x00 = 0xBF.
In order to clear the seven lowest order bits, 0x80 - (0xBF & 0x7F) =
0x41 should be added to 0xBF, and 0x41 is precisely the checksum of the
message.

6442. Uploading from the spectrum 128

Newsgroup: comp.sys.atari.st
Date: 1992-06-16 13:56:57 UTC
From: mjb@cs.nott.ac.uk
Message-ID: <1992Jun16.135657.7473@cs.nott.ac.uk>
Source record: 220831

For all you people who want to upload speccy games, but don't have the
RAM Music Machine, here's a way to do it from the speccy 128.

You need; A 6 pin jack like the ones used for a UK telephone lead (see spectrum
+2 manual circa page 199)
A 5 pin DIN plug
a piece of 2 core wire

To make the lead;
654321
+------+
||000000+
+------+

Connect pin 5 of the 6 pin connector to pin 4 of the 5 pin DIN lead (pin
numbers are on the back of the DIN plug) and pin 1 to pin 5 of the DIN plug.

Then you can use the spectrum MIDI port to send data to the MIDIXFER.TOS
program in zxupload.arc from atari.archive. You'll have to rewrite the
z80 routine, though because the MIDI port is at a different address.

The only drawback is; I can't figure out how to use the 128's MIDI
port from assembler, since it is also the RS232 port. TO get around this, use
the basic play command with the Z function to send data down the line,
something like

```
10 for n=start to end:play "Z"+str$(peek n):next n
```

Unfortunately this is very slow.

To get the program into memory, just truncate the z80.txt source after the
second call 1366 with an ret (decimal 201) and then randomize usr mcstart.

If anybody knows how to acces the spectrum 128 MIDI port in machine
code, either reply to me or to the newsgroup.

: Hi,
: I'm trying to write a fractal program that can do 3072 colors/screen
: (STE), and I'm not quite sure how to implement the palette switch after
: each scanline. Could someone please tell me where I can get info on this
: subject?
:
: Thanks.
:

I know of a french magazine that presented (with every information
you can dream of) an assembly (of course) code to display 512 colors
as the Spetrum 512: with 3 palette-switches per scanline. It sure
does work on an STE with 4096 colors.

ST Magasine, editor: PRESSIMAGE, PARIS (same address as Generation 4)
I haven't got any more precise information.

: Hiya all,
:
: Are there any LISP compilers for the ST out there?? Any good ones?? How
: about ProLog?? Thanks,
:
: Damian

Please don't try to find a Common LISP: SCHEME is a much better LISP dialect. I don't know of compilers, but for interpreters, there is XSCHEME at a.a or (much better) SCM and a lot of other very nice things (docs, other interpreters, libraries, programs, ...) at

nexus.yorku.ca
altdorf.ai.mit.edu

There is also a Scheme to C compiler at gatekeeper.dec.com but you have to adapt it for Atari (it is for Unix and there is an Amiga version) It is pretty nice, fast, powerful (with C linking of course) on my UNIX account but too big for me to adapt it on my Atari !

How small do you need it to be? Moshe Braner's GNOME is a very solid, slightly cut-down version of MicroEmacs which you can have as either a .ttp or an .acc. I think the executable is around 55k. It should be available from atari.archive, though I haven't checked this.

Source record: 220839

Thanks to everyone who answered my question. Here's the scoop
I downloaded GCC 1.4: the binaries, libraries, and includes.
Then I got it set up to run.
After the requisite quantity of parse errors, I was able to compile some
small programs. It seemed to have trouble with recursive data structures
and would give me the message "virtual memory exhausted."
However, I haven't had too much trouble with small programs and Gulam.
I tried a smaller CLI, and it liked that better.
But, I compared it to Sozobon for compiled program size and speed of executables
and Sozobon's executables are smaller and faster. So, I'll use Gcc as long as
I can without putting too much pressure on it, but I simply can't afford the
memory upgrade, and will use Sozobon for projects of any magnitude.
Some things that would make GCC work in a small memory environment might be:
* using the command line to call gcc-cc1

* using lots of small files and linking them

But I think I'll stick with Sozobon...

I'm moving and I have to clear out some things. Everything
must go, so if you see something you might be interested
in, don't be shy!

*** ATARI ST STUFF ***

1040 ST in very good condition. Has been
very reliable. 1MB. Mouse. TOS 1.4. $250

SC1224 Goldstar Color Monitor. Like new. $130

SC1224 JVC Color Monitor (original 1985,
the really nice one). $180

External 1.44 Meg 3.5" Floppy Drive. Self
contained with case and P/S. $100

520 ST. 1MB RAM. Questionable reliability.
$100

Spare parts galore. Keyboards, chips, disk
drives, more. All for $50.

Nitelite SP808 multiport serial device.
Eight ports. Multi-line BBS and drivers
available. Manual included. $100

Astra HD Case and P/S with room for 3.5"
HD and floppy. $20

*** PRINTERS ***

Morrow MP100 Daisy Wheel printer. Emulates
Diablo 600. $50

*** OTHER STUFF ***

9-track tapes. Many are brand new. Have
a dozen or so. $2 each? $15 for all?

Lot's of 8.5x11 3-ring binders. Brand new.
$8 per box of 25 (0.32 each)

Six-line push button phones for standard
key-system (you can get adapters for RJ
connectors). $25 each or $75 for whole
box of six.

>Warwick

My reasons for offering that advice are that it seemed he wanted a new machine as soon as possible. The TT is out now. Although I think the Falcon won't take the four or five years that the TT did to be released and that it will be released before the end of year, doomsayers will still say it's vaporware and that Atari may never release it. Then there's the usual bugs in first-run production models.

The TT is not going to drop in price, especially at the dealer-->consumer level. Atari has priced it too high because it's expensive to manufacture. The only way the dealers are going to lower the price are if Atari lowers the price.

Finally, the TT and Falcon are suited for different markets. The TT is high-end and the Falcon is low-end, entry-level. Of course, at its debut, the Falcon will look like the better machine, but it probably won't have the VME port and detachable keyboard that some high-end users require. When the STE was released, the old Megas looked pale in comparison. The same idea applies here. Many expect Atari to release a Mega-like Falcon after the initial release of the low-end version and finally a 040 version perhaps late next year.

So, my advice is, if you want a 68030, get the TT now. Sell it off later if you want to get the mid-range Falcon or whatever. But at least in the meantime, you'll have a nice computer to play with and you won't be doing all that waiting Atari users seem to do. :^)

Of course, all of the above is IMHO. Why would you take any other way? :^)

Source record: 220849

Dear Darek

In article <1992Jun08.224323.6838@microsoft.com>, darekm@microsoft.com (Darek Mihocka) you supply us with a long "hate mail". While I do not want to comment on the superiority/inferiority of the PC vs. the ST - I do agree that a 386/486 is a much more powerful machine than a ST and has a much better price/performance ratio than a TT - there are some other points I want to make:

(Just a small part of your letter:)
>
> "then you speed increses just went right out the door... not to mention your
> HD and memory space"? Well, maybe under OS/2. Under Windows, a DOS program
> runs at the same speed as without Windows. Of course, if you multitask you'll
> lose speed. So, duh, what a revelation. Unlike OS/2 which sucks up gobs of
> memory and disk space, Windows 3.1 can be installed in about 4 meg of disk

> don't want. Look at what FSMGDOS requires in terms of memory and hard disk
> space and it's similar. And I'm sure Multi-TOS isn't tiny either.
>

Point No. 1: Windows is s l o w ! ("How to turn a 386 into an XT? Run Windows!") Ok, if you use a fast 386/486 you will get a decent system, but just compare it to a Mac+: It's software is so much more cleverly designed, that is gives you GUI at a respectable speed on a hardware that one could call "antique". (This reminds me of an interview I read recently; in it N. Wirth said: "Todays software is getting slower at a greater speed than the hardware is getting faster." [I hope I translated this correctly, English isn't my native tongue...] Sounds like Windows, doesn't it?)
Point No. 2: Windows 3.1 uses "only" 4 meg? (Ok, that's nice compared to the 30 meg of OS/2.) Pitty is, the applications use lots of space: 7 megs for this wordprocessor, 6 megs for that spreadsheet, etc. Again, compare it to the Mac! If there is something that really uses lots of hardware ressources it's Windows & Windows-prgs.
Point No. 3: Don't tell me PCs are easy to programm... Especially if Microsoft doesn't hand out all the infos - of course that gives them an advantage on their competition...
Point No. 4: (The only time I will mention the ST, promised!) At home I got two systems, a 286-clone an a Mega ST. While I can still use my ST to run some decent programms supplying a GUI (yes, there are some decent programms, at least from Germany), there is little software nowadays for my AT (which I will trash before the end of this year). Now which machine was the better investment?
Point No. 5: Microsoft will love you for your marketing and - of course -

IBM-bashing. (Makes me wonder: Has everybody forgotten who
developped OS/2 in the first place? Don't tell me IBM has changed
all the code...)
Point No. 6: No, I don't hate Microsoft. Yes, I use Windows myself (on a 386,
btw), and I like a lot of the available Windows-programms. What
I hate to see is people claiming Microsoft products to be
ressource-efficient, fast, bug-free and in general the best
software available. I also believe there's more to (in?) life
than a MS-DOS PC!

(sigh!)

This just had to be said...

Greetings,
martin rosenkranz

You have been gone for years right? Anyways the 030 at same clock rate is
only at the speed of a 386 at same clock ratings. If you assume that a 030-33
would be the same speed of the 486-33, your out of your mind. Like I have
mention before do not post false info! Even my 030 is slower than my
friends 386-33, no way can a 030 at same clock speed be ever close to the
performance of a 486. One of the more recent ways to see the power of
the 486 is seeing GEMULATOR actually emulating 2x the speed of an ST. While
running other software emulations on a 030 to emulate PC, you only get the
performance close to a XT. My 030 using the emulation of EGA only emulates
1.6 - 1.8 Mhz XT speed.
By the way a 040-25 Mhz is faster than a 486-25 TRUE, but it's only upto
the speed of a 486-33 w/o Weitek 4167.

Jeff

#
#Umm, well I renamed the mercury dir to merc as Hermes was finding Mercury
and using some of the config stuff from it.
#
#About polling, are you running uuwork or uupoll?
you need to run uuwork [hostname]

You also can setup uuwork to poll automatically for you in a specific
period of time. Just set the time s in XHOSTS and you can leave your ST
Also You may let others poll your Site with uuwork.
(But be careful with UNIX Siters, which sometimes send 7 bit and
parity for login purposes. and the hermes login.ttp wants 8 Bit which
gets with 7bit&parity in serious trouble.

This states for the Version 1.00 (1.03 may be different.)
UUWORK still has the same features (I think only less bugs.)

Gruss

On the weekend I uploaded STDCAT V5.1b to atari.archive.
The filename is 'stdcat51.arc' and is in the 'atari/new'
directory (of course it may be moved from there by now).

In case you don't know, STDCAT is a disk catalogue program
and is just another useless piece of shareware.

Yea, but for us starving college students, there is always the
educational discount. (I'm waiting till fall to decide against a
Powerbook 140,PB 100, 386SX notebook, or the ST Book, if it ever gets
into production at a fairly competitive price)

Later.......

> software is getting slower at a greater speed than the hardware
> is getting faster." [I hope I translated this correctly, English
> isn't my native tongue...] Sounds like Windows, doesn't it?)

Funny you mention MACs, the MAC 030-16Mhz is said to be equal in performance
to a 386SX20 running windows 3.0 and the 030-25Mhz to 486SX running windows
3.0. Both came directly from MAC recent ads. (486SX performance is somewhere
inbetween 386-33 to 386-40, and this is 16Bit windows 3.0 program, run it
against OS/2 then lets see.)

>Point No. 2: Windows 3.1 uses "only" 4 meg? (Ok, that's nice compared to the
> 30 meg of OS/2.) Pitty is, the applications use lots of space:
> 7 megs for this wordprocessor, 6 megs for that spreadsheet, etc.

> uses lots of hardware ressources it's Windows & Windows-prgs.

Not bad if you consider most standard pc clones are dealing with 120 MEGS
of drive space. THE PC OS/2 v2. is a pig, but its a nice pig.

>Point No. 3: Don't tell me PCs are easy to programm... Especially if Microsoft
> doesn't hand out all the infos - of course that gives them an

I program on MACs, ST, and PC, I find the PC are very easy, I can just load
turbo c++ for windows and develop faster programs than I can on the MAC.

>Point No. 4: (The only time I will mention the ST, promised!) At home I got

> of this year). Now which machine was the better investment?

WHAT? LITTLE SOFTWARE, wrong there are plenty of software, let's see about
close to 50000 titles. Companies are still making software for the AT
machines.

>Point No. 5: Microsoft will love you for your marketing and - of course -

Made a mistake, I meant 1.6-1.8 Mhz AT speed which was still unuseable, an
XT turbo 10 mhz is at 3.4 AT speed to give an idea.

6467. .gl Viewer

Can anyone explain how to make GCC 2.1 produce smaller executables on the Atari? How, for example, do I use the "integer only" libraries iio.olb, and will this decrease the size of the executable programs I create? All of my executables are about 30-32 K for even small programs with minimal integer only I/O, and I think this is too big.

In reply to above messages compareing 68030 to 80486 etc.

My home 8Mhz 68000 Atari ST running Spectre GCR - Mac system 6.0.5 is easily faster than my work 80386DX 25 MHz - windows 3.1 - dos 5.0 running the same software. (WordPerfect - MS Word - Excel) Even though My PC at work has more memory.

Second the 68030 has 2 256 BYTE caches not a 512Kilobyte cache

Third internal design counts for a lot. I believe except for the 68030 the rest of a TT (read: memeory access even to TT Ram) runs at 16Mhz.

Opinion I have express are sure to be refuted by others

This might be a problem with memory. I do not remember wich TeX did it,
but I remember that one time TeX used more memory every time I run it
again. I have 4 MB so I could run it a couple of times, but then
I had to reset the machine. It did not release memory after it was run.

UVK tells you you can't check a HD bootsector but I have no idea why
(unless TOS doesn't execute boot code from a HD boot sector).

> Are there any/many link viruses (is this the same as a trojan?)

Appearantly only 5, but there is little reason why they can't be ported and
become more and more frequent.

>
> Can someone please post a nice message explaining all on how the HD
> works in comparason to floppy etc?

Assuming you mean the virii, they 'tag on' or overwrite code to other
programs, by opening them for read/write they copy themselves into you 'host'
program (ie the victim program), then when you run the prorgram the virus's
code gets executed first and looks for another program to infest,
resets, deletes files, etc.

'Link-virii' are particulary dangerous because they can be uuencoded and sent
over the net as binaries, downloaded to archives etc. boot-sector virii can
only do this if the whole disk is snap-shot (ie in msa format) and compressed
so when you decompress the file to disc, the disc is a exact copy of the
original.

Gotta go exam in 20 mins ! (Degree in Comp-Sci)

I doubt that there's any .GL viewers for the ST, or that there will
EVER be any...

You'll need an IBM emulator to run GRASPRT.EXE to see any GL files...

92Jun15 8:27 am GMT from qb7g6 @ fel.tno.nl (TNO Physics and Electronics Laboratory)
Hi,
I'm trying to take control over my Roland Sound Canvas (SC-55) with my Atari using Turbo C 2.0.

For system exclusive MIDI messages, Roland requires the last byte to be a checksum. Of course, I'd be glad to compute it and give to the needing thing, but HOW? I don't know whether to add or xor, or which bytes to take into account, I can't find anything. Trying it out takes too long; on every wrong checksum, the canvas displays "Check sum error!" for about 1.5 second.

If anybody knows anything on this subject, please mail me!

Thank you for reading!

Maarten Landzaat, BSO/Aerospace & Systems, qb7g6@fel.tno.nl

In response to the above message:

Maarten:

I may be able to help you, since I faced a similar problem a while back trying to do sys-ex communications with a related device, the Roland D-110. I assume you've looked at the data sheets in the back of the sound canvas manual - you'll probably find that it says something like this:

* The error checking process uses a checksum that provides a bit pattern where the least significant 7 bits are zero when values for an address, size, and that checksum are summed.

As you can see, Roland manuals are not printed by someone who speaks good English. However, I managed (mostly through trial and error) to translate that. Here's the bit of C code where my program calculates the checksum:

...

```
char msg[44] /* message length should be 42 */
= {0xF0,0x41,0x10,0x16,0x12,0x20,0,0,
0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,
0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,
0,0xF7 } ;
...
```

```
sum = 0;
for(i=5; i<40; sum += msg[i++]);
msg[40] = (128 - sum % 128) % 128;
Midiws(41,msg);
...
```

The "sum" is calculated using the part of the sys-ex message beginning with (and including) the MSB and LSB of the data size (bytes 5 and 6 in my array) and ending with the last data byte. The (128 - sum % 128) % 128 is the tricky bit. Frankly, I don't really remember the logic that went into that statement - but it does work.

The system exclusive specs are identical in the manuals for my Roland D-110 and S-330 sampler, so I assume there is some kind of Roland standard - in other words, I'll bet this will work on the Sound Canvas.

Note that the checksum should be placed immediately after the last data byte, and before the 0xF7 which signifies the end of the sys-ex message. (msg[40] is where the checksum goes in my example)

Good luck. Let me know if this works, or if you need more help.

The main thing I believe slows down the TT is the fact that the OS is in
ROM. Another possible problem is that Atari may have used a compiler which

doesn't do very good optimisation for the 6830, possibly not using the fast bitfield op codes.

>even the 040 is to replaced by an 88110).

Mr> Excuse me! The 68030 is approximately the same speed as the '486 at the same
Mr> clock rate,

I don't know what planet you're from, but here on earth we use the term
"same speed" to mean "equally fast". Clearly, this is different from
your definition, because the 486 is *way* faster than the 030 at the
same clock speed. Just look at any benchmark you can find... the 486
will blow the 030 away. (see below for examples).

Mr> the 68040 is about 1.5-2 times the speed of the '486.

This is BS also. The 486 is slightly *faster* than the 040 on integer
operations and slower by about 40% on floating point. This fact
completely invalidates your claim that the 030 is even near the 486 in
performance, since moto even itself claims the 040 is 4 to 5x the speed
of the 030.

I have nothing to gain by saying the above, I think Moto has always had
a superior architecture, etc and I personally *own* an 030 box.
But in *raw* performance they no longer have anywhere near the lead they
used to over Intel. I just can't stand the level of misinformation
you're spewing here.

IMHO, someone in the US looking at setting up inexpensive UNIX
workstations would have to be absolutely RETARDED to buy anything
but an Intel box. With the current state of the market there is no way
Moto boxes are going to touch Intel boxes on price performance.

Don't take my word for it. Here are SPECmark numbers from an objective
source:

You seem to have a *very* old version of Mtools. In the old days
there was this problem and #define DUP_FATS or some such that was
necessary. But Mtools 2.0 does things correctly (from fat_write.c):

```
void
fat_write()
{
int fat_start, buflen, dups;
void disk_write();

if (fd < 0)
return;

fat_start = dir_start - (fat_len * num_fat);
buflen = fat_len * MSECTOR_SIZE;

disk_write((long) fat_start, fat_buf, buflen);

/*
* Only duplicate the FAT table if no errors were detected
*/
if (!fat_error) {
dups = num_fat - 1;
while (dups--) {
fat_start += fat_len;
disk_write((long) fat_start, fat_buf, buflen);
}
}
return;
}
```

Bye,

I have a atari 1040st, and I play the electric guitar. Now I
hear that the atari's are known for music capabilities, so how do I get
set up? I don't know nothing about midi's, so what do I need to get
my guitar/atari st to get some midi action? Also can someone tell me
what the midi through the computer does, meaning whats the big deal.

Thanks.

>You'll need an IBM emulator to run GRASPRT.EXE to see any GL files...

You do have another option, and that is to take a copy of
the X11 gl viewer can't remeber it's name, and alter the window
code to either use a GEM window, or straight to the screen. Takes
some work, bu tit depends on how much you want one.

Saying that, you could also take the gl lib program, and
extract all the picture files, if they are GIF format convert them
to say DEGAS, relib them into a different gl file, and hack the
viewer to load a DEGAS sequence from the gl file. Mind you this
also sounds a tad complecated, Just thinking out loud! :-)

From: sheppard_r@kosmos.wcc.govt.nz
Message-ID: <1992Jun17.105945.16887@peponi.wcc.govt.nz>
Source record: 220768

Well I don't think this got out of here so I have posted it again..

Help, does any one know of a Good Memory Test Program, that tests all fited Ram, not just what the OS thinks there is..

I have a Ram problem with a Mega 1, the upper bank is dead, but would like to find if its a Ram fault or a MMU fault, and which ram it could be..

Note: the Supra ram test program only tests what the OS tells it there is, so it will never test the upper bank, also the Supra one does not Test 2.5 meg setups..

There was one sime time back that would locate and list the Ram chip, does any one know what that was called, I think it was to do with a ram upgrade article..

Thanks... Roger..... sheppard_r@kosmos.wcc.govt.nz

Try clisp from terminator.cc.umich.edu /atari/languages.

6482. Ram Upgrades

Newsgroup: comp.sys.atari.st
Date: 1992-06-17 11:27:35 UTC
From: sheppard_r@kosmos.wcc.govt.nz
Message-ID: <1992Jun17.112735.17249@peponi.wcc.govt.nz>
Source record: 220771

Well I have just upgraded a Mega 1 to 2.5 megs..

This machine was fitted with 256 * 4 Drams, I just removed the set of 4 at the front, and placed SIMMS that are stuck together with double sided tape in front of the rams that I had just removed, also with double sided tape, there is plenty of room in this machine to upgrade them to 4 megs..

The SIMMS that I used were the 3 chip type, they use 4 meg ram chips in a 1 * 4 config and one of 1 * 1, this is the PC parity bit that is not used, I connect the inputs to VCC..

The Power Supply that is fitted to this Mega 1 is the same as a ST/STE one, But for one thing, it has much thicker and larger Heatsinks, ie, they are bent over at the top and are some 1/8" thick..

Some MMU's don't work with 2.5 megs, a ST-Format or ST-User some time back had a list of these MMU's that would not work..

If some one knows the date and which magazine could they please let me know..

Thanks...

Roger..... sheppard_r@kosmos.wcc.govt.nz

Because Michtron is a multi tasking setup, it won't go any faster.
Also if you logon to the console while someone is downloading at 500cps
you can see that figure drop quite a bit.

AFAIK Michtron went out of buisness well over a year ago, but Tim Purves is
supposed to have bought the rights to the BBS program. Correct me if I'm
wrong about that someone..

I have put up with GDOS V1.1 long enough and am going to upgrade, but I am unshore of the difference between FontGDOS and FSMGDOS. Can anybody tell me:

i) Whats the differance.

ii) Which is best.

iii) Cost !!

With Tanxs.

6485. Multisync loss/ST lock-up with modem pwr.

Newsgroup: comp.sys.atari.st
Date: 1992-06-17 14:17:52 UTC
From: rgoseweh@digi.lonestar.org
Message-ID: <1992Jun17.141752.9548@digi.lonestar.org>
Source record: 220779

Here is the problem: I recently purchased an NEC 3DS for my 16 Mhz 1040ST. When I power up the modem (via MasterPiece Plus), the monitor either goes completely black or I get double screens side by side (very hard to read :-). The only way to recover is to reboot the computer, usually with the reset button as the ST seems to be locked up (i.e., alt-ctl-del & alt-ctl-rshft-del) do not work. The problem also occasionally occurs on modem power *off*, but not nearly as frequently. Anyone have any clues?

Gory system details follow:

1040ST (TOS 1.4) w/ AdSpeed & 2.5 MB RAM (Z-Ram 3D/4)
NEC 3DS & Radio Shack 1 watt spkr/amp via Omniswitch (1)
ICD FaST (early model H.A.) with single ST157N
SuperCharger (separate PS & at end of DMA chain) (2)
UDS 2400 baud modem w/MNP5 (I forget the model number) (3)
Kensington MasterPiece Plus filter/power controller. (4)

Notes: (1) First try was with IB Multi-Sync switchbox. Same problem but I thought it was due to the 15 feet of monitor cable and 4 connectors / adapters that the signal was traveling through - even with a power supply plugged into the IB. :-)

(2) Problem was present before SC was added (shortly after NEC 3DS was added).

(3) I.E., the problem initiator :-(

(4) Due to limited desk/shelf space, power cords from MP+ do run very close to back of the monitor. But the monitor is allegedly shielded (3D"S") and how much power can a modem draw anyway? Note that phone line to modem runs through MP+ for surge protection.

Thanks for any information or suggestions.

> friends 386-33.

In side-by-side comparisons of some 3-D graphics routine that I wrote, which use the Intel and Motorola co-processor, I found the following to be true:

68030 is faster than the 386SX at the same clock speed
68030 is about the same as a 386 at the same clock speed.

Given that I used GCC 1.38 for the TT compile and Borland Turbo C++ for the PC compile, I'm tempted to say that the 68030 is roughly equivalent to a 486 without the 486 cache. This assumption is based on the the relative appraisal of GCC produced code versus Borland produced code. I may be talking "from my ass" on this, though...

To be fair, lets have somebody write a quick-index test for a 386/486 running windows. Compare window's dialog open/close time etc to GEM's on the TT. We may be shocked.

I was just reading back over this, and it struck me what was wrong with this. The LCII (like the LC) has _2_ MB soldered on-board. This when added to the 2x4MB SIMMs is 10 MB. It makes me wonder though, just how much money Apple saved by not including two more SIMM sockets (and the trivial support lines - most memory handling chips support at _least_ two banks)?

Anyway...back to your regularly scheduled program...

>the PC and then compare them.

Actually, the TT has no cache except for the 256 _byte_ address/data cache that is on the chip of the 68030. A 486 has a 8 _Kbyte_ address/data cache on-chip in addition to any external cache (the 64k-1MB caches you hear about). I believe (but I am not sure) that the 68040 has an 8 _Kbyte_ address/data cache (4k each) - I know for sure it is much bigger than the '030s cache but I forget the exact size. And yes, the speeds would be much more comparable if the cache sizes were comparable.

>performance of a 486.

What do you base this opinion on? And how much cache memory does
your friend have in his '386? At least 64k, right? Does your benchmark
(whatever it is you use to compare the two machines) use cache, or does it
do sequential read/writes that are more than the cache size? Even if it
does this, it still might be get an artificially high rating because most
caches are filled in burst-filled prefetches so that you get better performance
even if you are doing worst-case benchmarks (cache-wise). If you must compare
two processors from looking at their respective systems, remember you must
make sure their systems are comparable or you are going to mistake system
superiority for CPU superiority.

> One of the more recent ways to see the power of
>the 486 is seeing GEMULATOR actually emulating 2x the speed of an ST. While
>running other software emulations on a 030 to emulate PC, you only get the

>1.6 - 1.8 Mhz XT speed.

Tsk. Bad example. This is just comparing two emulators, not comparing
the equipment they are running on. BTW, last I heard, the GEMULATOR (is it
really in all caps? :) was running at 80% of ST speed - did he speed it up?
Oh, and the TT emulates EGA because no one has bothered to write an emulator
that supports TT video cards - now that's a shame.

>By the way a 040-25 Mhz is faster than a 486-25 TRUE, but it's only upto
>the speed of a 486-33 w/o Weitek 4167.

Sure, but what about the 040-33? Especially with comparable cache
sizes? Please, if you must compare INTEL vs Motorola machines,
please make sure you are not comparing apples with apple pies -> they look
similar, but they really aren't. After all, it may take longer to cook an
apple pie, but it sure tastes better (to me anyway).

6495. How much is my system worth?

Newsgroup: comp.sys.atari.st
Date: 1992-06-17 18:09:53 UTC
From: meggin@epas.utoronto.ca
Message-ID: <MEGGIN.92Jun17180953@epas.utoronto.ca>
Source record: 220797

In a month or two, I am considering selling the following system:

o Atari mega 4 (3.5 years old) with replaced floppy drive.
o SM124 Monochrome monitor, mouse.
o Bytesize systems 50 MB Hard Drive, approx 32ms. seek rate.
o Atari SLM 804 with 1 toner catridge in use, another new (unopened).
o Assorted software, including Calamus 1.09 + many (licensed) fonts.

What should I sell this system for in Canada? I had thought of about CAN$800.-: is that just right, too much, or too little? Of course, we don't expect to recoup much of the CAN$6,000.- which we put into it back in '89, but it would be nice to get a few hundred, at least (we'll be in Ottawa by the time we are ready to sell).

Feel free to reply by private mail or over the net, and thank you for any advice.

David

I'm selling an 80-meg external SCSI hard drive. The case/power supply is by LaCie (originally housed a LaCie Cirrus 30), and the drive in the case is a Quantum, purchased from Hard Drives International in November 1990. Comes with a recent version of Silverlining formatting software (from winter 90/91), loads of PD software, and System 7 installed.

If desired, I can also sell MS Word 4.0, THINK C 4.0, and/or Fastbask II, including original floppies and manuals.

I'm selling the drive because my Mac died. It works great -- fast and quiet. I have original invoices for both the case and the drive. I also have mounting hardware if you prefer to install the drive internally.

I paid $500 for the Quantum alone in 1990. The case/power supply is worth about $100. I will, of course, accept substantially less than $600, given that the drive is used, and prices have dropped.

Mail offers to joey@postgres.berkeley.edu, as I do not read these groups with any frequency.

Joe Hellerstein

Where did you hear this information? I thought that Worm Perfect had given up on further development for Atari.

Terminal program. I personally use Freeze Dreid Terminal or Vanterm, I have
very little perference. You will also need a protocall program. Usually this
comes with the terminal. The most common are X,Y and Z modem, X is the slowest
Z is the fastest. Mose STs need a RTS/CTS patch (but this usually only applies
to high speed modems.) TOS 1.02 (1.2) is supposed to be free of this but...
As for a list of BBSes Atari ST review have a long list on one of their back p
k
pages. Cix is a good commercial system with 'conferences' specifically for the
S
ST. Mail me if you want more information.

>chip that is needed 'AJAX' I think.
Atari Benelux has announced their own upgrade kit for this containing
TOS 2.06/3.06, AJAX, and a disk drive that has the same front panel as
the original ones. They will also sell the parts of the kit separately.
Especially the disk drive is of interest, since other ones require modification
of the housing.

> Anybody know of a Source in Europe ??
I've seen a British firm selling ST parts on a Dutch fair, I think they
are called "Best Electronics". If you cannot locate them, you might try
the more-or-less official Dutch parts dealer:
ATIN electronics
P.O. Box 16069
2301 GB Leiden
phone 071-153555 (this the number to dial from The Netherlands)
They accept VISA, AX and EUROCARD. I don't know if they are prepared
to ship abroad.

> Apart from replacing the drive, the floppy controller chip and
>upgrading TOS to 3.06 what else must I do.
At least for a Mega STe, Flip dipswitch 7 to enable the HD selection button
in the formatting dialog form.

Could you be so kind to be more specific?

1. What's the name of the program? Path on ftp.uni-stuttgart.de?
2. On what system does it run?
3. What disk recording formats/densities are supported?

The only thing I know that there exists a DOS program that is able to
read/write/format Mac HFS 1.44-MB disk, because they are also formatted
in MFM mode, like normal DOS disks, only with a different file system
(HFS). But it is impossible to r/w/f a 720-KB disk in GCR format with
a DOS/TOS disk drive without additional hardware.

6506. Video & audio to SC1435 or SC1224

Newsgroup: comp.sys.atari.st
Date: 1992-06-17 22:50:42 UTC
From: chan@pyramid.unr.edu
Message-ID: <3983@equinox.unr.edu>
Source record: 220798

Awhile back I inquired about this question and received no response,
so here comes again...

We know that the audio/video plug from an ST(e) computer to the
SC1435/SC1224 color monitor is not a standard audio/video plug found on
stereo and t.v. systems.

My question:
Is there any way for a component such as a VCR or GAME machine
to send its video/audio signal to the SC1224 (on the SC1435 the STEREO
audio would be separate)?

ANY suggestions are welcomed!

Please send email or post!

>I hear there will be no 68050, only a 68060... :-)

Most likely. Motorola use odd numbers for "enhanced" versions of the lower
even numbers.

a 68010 is an enhanced 68000 (So few changes, no-one uses 68010)
a 68030 is an enhanced 68020 (The gcc switch in -m68020)

How do you enhance a 68040? Why bother, the '060 is suspected to be radically
different.

6513. are STBooks being sold in Canada?

Newsgroup: comp.sys.atari.st
Date: 1992-06-18 02:20:00 UTC
From: ugafence@ubvmsb.cc.buffalo.edu
Message-ID: <Bq0p2u.L7M@acsu.buffalo.edu>
Source record: 220653

To anyone in the know:

Are STBooks being sold in Canada yet (or the US for that matter)? I'm wondering about the Ontario area in particular. I live in Buffalo and do not know of any Atari hardware dealers in the area; consequently Ontario seems like the next best choice.

If they are being sold:
- are you aware of pricing
- and what dealers do you recommend

If they are NOT being sold:
- are you aware of any release date

I would greatly appreciate any information that anyone might have. My preference is to stick with Atari, but a friend of mine can get me a Mac Powerbook 140 for about $1500 US. Very tempting...

Thanks in advance,

.Philip

6514. CS-Tex and printers

Newsgroup: comp.sys.atari.st

From: raycole@matt.ksu.ksu.edu
Message-ID: <11osqtINNl65@matt.ksu.ksu.edu>
Source record: 220656

I just downloaded and got CS-TeX up and running on my 1040ST (it does run in 1 Meg, its just a little tight ;)) and now have a few questions. First, is there anywhere that I can obtain an english copy of the docs included with it? Or is there anything that I really need the docs for? Second and most important, I have an Epson LQ-510 printer and am wondering what is needed to print in high resolution mode with it? The Nec P6 works to print, but only in 180x180 mode, and I believe that the LQ series is capable of more than that (feel free to correct me if I'm wrong, I don't have the printer manual here with me so I can't say for sure). Thanks for any help that anyone can be.

>
>From my experience, the "virtual-drive B" exists only for GEM, not TOS !!!
>So a .PRG or .APP program can do without worrying about it, but .TOS and
>.TTP will use drive A: WITHOUT WARNING FOR DISK SWAP !!! So you get
>a lot of data destruction. Drive A: will report a disk swap if you change
>B: will use the FAT and directory listing of the previous disk, and do it's
>stuff on the new one. Deadly !!!
>
> Patrick BETREMIEUX

This is wrong. The only differentce is that with the non-GEM critical error handler, the disk swap is handled silently without user notification (of course that means that it's relatively useless in this case).

Having some non-STE machines around (Mega ST, 1040STfm), I am curious as
to whether this bug that has been reported on the STE is also present in
the earlier machines. All my machines had the '38 DMA chip.

>I agree that the 040-33 cpu is quite fast, infact I wouldn't be much
>surprise if it does a little better than the 486-50.

According to an article in a magazine I read about a year ago (I think it could have been Byte, but I'm not sure, I think it was in an article on RISC v CISC processors) the following is true:-

The number of instructions per clock pulse relative to a SPARC 1 processor were approximately as follows:-

68040 2/3
80486 1/3

This is of course theoretical.

From what I've gathered, for optimal code, the 68030 is about 70-80% of the speed of the 68040 and about 50% for sub-optimal. This would make the 68030 approximately the same speed as the 80486 (theoretically).

This doesn't mean to say that a machine with a 68030 and one with an 80486 will run at about the same speed. This totally depends upon the rest of the system architecture and the optimisation of the OS for the particular processor.

If you added a very large, very fast instruction and data cache to the 80486
then you could probably get up to the real speed of a 68040 machine without
and external cache and vice versa.

All I'm trying to say is that just because MACHINE A outperforms MACHINE B
it doesn't mean PROCESSOR A outperforms PROCESSOR B. These days the
processor IS NOT the speed bottle-neck.

>etc. before dumping to DAT or analog tape. Atari would be all over it.
16bits Stereo does not necessarily equate to CD quality. Quality is also
affected by differences in sample rate, the quality of the analogue output
filters, accuracy of the ADC and DAC converters, phase coherency between the
two channels, ...

Most CD players also employ oversampling to improve output quality.

If you want an illustration of how different 16-bit systems can sound, compare
the Cheetah SX16 sampler with an Akai S1100.

The dvi drivers that come with CS-TeX understand a switch (I think it's -v
but I don't know it for sure) that causes them to print in other resolutions
than the standard ones.

Source record: 220669

When I bought my ST back in 1986, I only got megaroids and First Word with the machine, this was back in Disk-Tos time. Some time later there was a lot of hype going on about Sundog, but before that I played Brattacus.

It was a game not needing the TOS-disk, so it was quite ok. There were of course
lots of games before that anyway. So Sundog was definitely not the first game,
major or not.

Jarle.

Tos1.4 only requires folderxxx (or extra folders in ICDBoot(s) config) in extreme cases (subdirectory tree 20 folders deep, bunches of files open at once, etc). I uesr folder300 w tos 1.0, and now I ues folder040 for added space (I've got 2Meg) since I have 80meg of files and run up to 4 programs at once (not counting acc/auto)

Atari France sell it, and there is somewhere in Paris a place to buy it.
However, you don't need AJAX to handle 1.44 Mb disks. I have such a drive
in my TT, and I have changed nothing at all, execpt the 7th switch.

Even TOS 3.05 handles High Density.

So do nothing, and give up searching for the AJAX !

DM> space, almost half of which is scalable font files which you can delete if

4 MEGS?? Gee, and we're doing the same thing in 192K of ROM. Doesn't that seem a little peculiar to you?

You know, it would be really nice if I didn't have this firm assumption that MicroSoft was paying you to say all this. I also firmly recall your "articles" in ST-Report telling us about how Atari would be dead in 6 months (and that was almost 3 years ago). You're trying to imply that I know nothing about Windows applications or PC designs. That's bunk. I've programmed for Windows (gee, wonder what all those damn huge libraries were for - they're all built in on my ST!) and I've worked around PC's since

What this boils down to is if you're gonna sit here and bash the ST, get out of this newsgroup. We're not interested in your obviously biased opinion.

Hi John,
> However, is -lh5- documented anywhere? Did Thomas make this
>format up himself? If not, couldn't someone else write a nice
>portable version in C? Granted it wouldn't run as fast on an St,
>but at least those people who have to uncompress things on other
>platforms could take them apart.
The lh5 format was "invented" by the guy who wrote LHA 2.XX for MS-DOS (the japnese guy with that strange name). Some Amiga guy ported the MS-DOS source (assembler) to the Amiga (using C) and called this packer "ar". A german ST BBS sysop (Alexander Bochmann) got the sources and gave them to me. I just compiled them (and produced a very buggy, but working lh5 compatible version for the ST) and gave the sources to Thomas who re-ported it to assembler and added it to his old LZH 1.XX, thereby creating LHArc 2.00 for the ST.

The original C sources from the amiga should be available on the better amiga servers, a portable C version of LHArc 2.XX can be found on a.a.u.e within the unix directory. The C-sources for a small lh5-only packer/extractor as well as the assembler sources for LHArc 2.01l are available to the public on a German BBS (I think it's Maus HH2).

[This is more for the public, don't take it personally]
As you see, it's no problem to get sources for lh5, so I can't understand why some people are always saying the .LZH files cause problems. Take any LHArc-Version 2.01l and you will be able to extract EVERY LHArc archive created by whatever program on MS-DOS, Unix, Amiga or Atari.

It's also no problem to get the sources (well, currently there semms to be one: My mail requests to a.a.u.e are not answered, allthough I did not exceed my quota and the message has reached a.a.u.e. What's wrong up there??)

Currently, there are two good archivers for the ST: Zoo 2.1R4 by Gereon Steffens (the guy who wrote the Gemini Shell) and LHArc 2.01l by Thomas Quester. Zip is very fast on text files, but has a worse compression and big problems when compressing whole trees (these archives are not compatible wiht MS-DOS zip). ARC is dead, dead, dead, the new Arc versions for MS-DOS are commercial software, the method used is (c), Game Over. I personally do prefer LHArc.
/s/ Udo

>them yourself!

If I am to look at them, I need to know what ads. I am looking at a PCWeek ad from Motorola, but unfortunately it only shows the Quadra 950 ('040 @33MHz) and even the Quadra 700 ('040 @25MHz) beating the ALR VEISA 486/50 in the Ingram Performance Report - it shows some other 486s (33MHz ones) but no other systems that use the '030. Perhaps you are talking about a different ad. Besides, what I said was true, regardless of whether you are talking about a Mac vs. IBM, Atari vs. IBM, or Tandy vs. Sun - you must still have comparable systems if you wish to make any meaningful comparisons of the processors used.

>
>>
>> Tsk. Bad example. This is just comparing two emulators, not comparing

>an ATARI is wrong, I'm running on SOFTPC-AT emulations. Last I heard from
>Darek is that on a 386 it was at 80% of the ST speed.

It doesn't matter whether I was assuming you had/used an Atari w/ emulator or not. Its a fact that varying quality of software in emulators, _compounded_ with the vageraries of the system it is running on, will give widely differing results; Hence my statement that it is not very useful to compare emulators on differing machines. Running a crappy Atari emulator

on a 586/100IBM that gives the equivalent of a 1.8 MHz Atari, while running an emulator on the Atari that gives the equivalent of a 386/33 MHz IBM running windows would _NOT_ neccessarily mean that the Atari was faster than an IBM 486/33! That is the point! (BTW - this is not a swipe at Derek - I applaud his programming skills to have produced such a product and he is a good example of how the envolpe can be pushed - something that has yet to be seen on the Atari IBM emulators...)

>>
>>
>> Sure, but what about the 040-33? Especially with comparable cache

>>
>>
>
>I agree that the 040-33 cpu is quite fast, infact I wouldn't be much
>surprise if it does a little better than the 486-50.

According to the ad I quoted above, the Quadra 950 w/ '040@33MHz runs about %20 faster than the ALR 486/50. However, it does not state whether or not that was with similar/comparable caches - and it is not neccessarily a good idea to assume that they are - does anyone know if there are memory-direct caches available yet for the Quadra 950? I don't believe (ie not sure) that it has any cache, other than that which is on-chip.

BTW, the Ingram report used programs that were available for both machines to perform this benchmark, so even those figures can be suspect. Granted, they will be much closer as each program will use the same algorithms to implement their programs and the variances will be more affected by the hardware they are run on, rather than the relative efficiency of the micro-code, but the effects of the differing micro code _are_ there.

And of course, you could get completely different benchmarks if they are done on a future Atari '040 model.

QUIT
get completely different benchmarks if they
are done on a future Atari '040 model.

>Which opinion is wrong?
<stuff deleted>

>Internal bus speed of TT - ?? open to question.

Technically, it is an asynchronous bus, and _could_ handle sustained
exchanges on the bus (to the CPU) of 32 MHz, BUT (and I can't type big enough
to emphasize this) there is nothing else in the computer that _does_ handle
32MHz exchanges (so far) so the point is rather moot. Right now, the TT is
as fast as the devices it uses can go. BTW, if you put a VME card in the
TT that could handle 32MHz exchanges, you wouldn't really get 32MHz throughput
because, besides the fact that most instructions are at least 2 cycles long
(typically 4 cycles, and even more if communicating with slow RAM), I believe
I read somewhere that the VME bus introuces one wait-state on all accesses
through it. If you were to put 30ns memory on the TT bus, yes, you should
be able to access it in 32MHz bursts.

In an earlier post I, by accident, placed a 'K' next to the 512 figure
for the amount of cache in a TT. Clearly I did not mean this and what
I mean't was 512 bytes (as so many have pointed out). However, the
context of my remark should have many many of you realise that what
I mean't was _indeed_ 512bytes. The whole point of my post was
that we are not comparing like with like and the fact that my work place
486 has 256KKKK of cache (external though) means that I can't really
compare the computer cpus. I can of course compare their box
performaces, and in this case the 486 BOX wins. What would be nice is
if someone could produce a cache add on for the TTand then see about
speed differences.

Source record: 220682

This letter is aslo in defen(s/c)e of UMS II. Okay it is a HUGE game, taking many hours to get into and complete, but that's a plus I feel. If I pay the prices software houses are asking for software (I didn't get an 'inexpensive' version) I expect to get value for money. If it's an action adventure I **EXPECT** superior graphics and gameplay for $60 (CDN); if it's a strategy game I expect great detail and, again, great gameplay; if I buy a simulation i expect attention to detail and something that will keep me playing. I feel UMS II fits the bill in the last category (as I did with SIM CITY and F19). Sure UMSII is big, but the attention to detail and numerous external influences on your troops performance MAKES the game...not detracts from it. I don't mean to sound ridiculous but if you want a quick action adventure get another piece of software, if you want an authentic, realistic and detailed simulation...get UMS II.

p.s. No I don't own stock in the company :^)

6545. Cheap color monitor?

Newsgroup: comp.sys.atari.st
Date: 1992-06-19 00:42:12 UTC
From: bigham@hercules.acpub.duke.edu
Message-ID: <3390@news.duke.edu>
Source record: 220692

Now that I have my new Mega STe :-D, I'd like to hand my 1040STf down to my family. The only problem is that I didn't get a new monitor with my new computer, and giving my family a computer without a monitor would be silly. So I'm looking for the simplest and cheapest way to attach a color monitor or TV to the ST [gotta be color, since my brother wants it for the games :-)]. I've got an old Thompson composite monitor that I had connected to my 800XL, but the ST doesn't have an RF modulator, so I doubt that would work (would it work in the television port of the MSTe, though?). Can a modulator be easily added to an ST? Is there another better option? Barring all that, anyone got a color monitor they're willing to let go of cheap? :-)

As always, thanks in advance for all help.

>

Ok to find this ad find the one which compares the POWERBOOK to the SXs.
I'm not familiar with the ALR 486 50, it's even more harder to believe
on this comparison test ad from "Motorola" that a Q700 would be as fast.
Look at perhaps the PC mag on 486 50DX vs. Quadra 040-25. It shows the
486 beating the Quadra beast almost 2 folds everytime.

>>>

>

Take into account that there are now numerous PC emulators floating
around for the MC cpu world and none can do as good? I mean Darek
pretty much hit the jack pot on the very first MC68000 computer emulator
doing that well. This emulator is actually the first software emulation
of a MC68000 based machine on running on the Intel cpu, come on.
I know SOFTPC has been trying, infact they release new versions of SOFTAT
which I mentioned.

>>
>>I agree that the 040-33 cpu is quite fast, infact I wouldn't be much
>>surprise if it does a little better than the 486-50.
>

> According to the ad I quoted above, the Quadra 950 w/ '040@33MHz runs

Then again you are looking at a Motorola ad, and then again we were talking
about 030 equal 486 at same clock speed. I'm not familiar with the Ingram
test, but there are certain things that may affect the performance of the
ALR486 machine just like many tests that affect the 040 machines. Look

at the SPEC chart posted earlier.

Message-ID: <1992Jun19.013951.11228@ucsu.Colorado.EDU>
Source record: 220694

Ok, my original posting of "TT prices" was to inquire the cost to purchase
a TT at this time due to the fact that I just sold my MAC 030 machine.
One thing I did not mention during this little discussion was that
a 486-33DX is this roughly: 386-33DX + 387-33 + 8k cache. Now this
means that the 030-33 would be at the speed of a 486-33 if the 8k cache
was turn off and the 387 disabled. Now I'm not familiar with the internal
structure of the 040, I mean how one gets from a 030-33 to a 040-33, but
if its not near what Intel did, we should expect to see performances
of the 040 at same clock speed as the Intel to be faster. This may support
what some has already stressed, but I just wanted to make it clear that
not all of us here are wrong.

Look for a "Video Key" product at your local Atari dealer. (What? No
local Atari dealer??? IMAGINE THAT!) It allows connection of a TV
and/or VCR to STs which don't have the built-in RF circuitry.

I just upgraded my ST520 last weekend. I needed three attempts to do that
because I did not solder properly. Take your time for doing that.
I even took all the old RAM out, so I could get the address lines A0-A8 from
a RAM's location. I used the additional serial resistors only in the CAS1L
and CAS1H lines.

If you need more advice let me know

cheers andreas

PS : I used the IMEX 4MB upgrade from a company in Germany

Hello,

I have an 1040st, 2 floppies Drives, color & mono monitor.
I also have a keyboard with a midi interface. I would
like to use my ST with this keyboard to learn how to play
the panio. Can anyone recommend midi software for someone
who just want to learn to play?

I don't need anything fancy, just something to teach me to read
music, provide interactive drills to build up skills, and work
on a 2 drive system. (I don't want to buy a harddisk).

Thanks,

Tony Denault

>--
>Russel Mar (bbs.ruscal@tsoft.sf-bay.org)

I have thought that myself, I think that the problem with the STE was noise, causing problems with this chip, due to a poor lay out and long DMA leads as well.

All the early mods to fix the DMA fault were of the noise fix type, by ICD and Atari, adding caps shorter leads, etc..

Note: this chip was/is only rated at 1 * LPTTL rating, I did find that the new chip has a lot more drive, I can leave my Supra host adapter pluged in a turned off and still read disks, this was not possible before..??

Food for thought...!!!

Yesterday, I received from Germany the new version of this
astounding drawing program. (All I did to get it was to send
the shareware fee (DM20, ~US$13) to the authors when I got it
from a.a.u.e. and saw I'd use it intensively).

As it seems that many (?) people here use this program, and
as it's sure (??) they paid the fee, I think it would not
be difficult to find somebody to talk with about this new version.

That's what this posting is for. Thanks for any reply.

Well, I believe your 1040 STf might have the capability to get
composite output (in your manual one of the pins should say "composite"
or something), I used to have the same monitor and had it hooked up with
a cable I got with my computer. You might want to call Toad Computers
or Redmond Cable (they made me a cable to hook up to my Magnavox RGB),
I don't have the numbers now but I can dig for 'em if anyone is
interested. Of course, hooking up to a composite monitor gives much
poorer quality than an RGB, but it is better than the TV, where you can't
even read the text in 80 columns. BTW you can tell for sure if you
have a modulator by checking for an RCA plug with a little TV picture above
it, also a small channel switch. I believe any ST which has these has the
modulator and therefore the composite output.

Conclusion : Go for the composite monitor if you can get the cable,
if you don't have a modulator at all maybe just buy a used color RGB.

Oops! Sorry for the mistakes... Of course TOY Prolog is the predecessor of
Prolog-68... BTW, will there be a version of Prolog-68 which can create
an executable file?

hi everyone!

i am a long time user of PCs and have recently got into using my old 286PC to do some MIDI sequencing (i use MPU-401-IPC and Cakewalk 3.0). this all gone along just fine at first. but now, am no longer happy with some character based (read DOS-based) user interface for MIDI stuff, and i remember about 2 yrs ago i used a NOTATOR software by CLABS on an ATARI MEGA something...and now i am looking high and low for it...

now, the question is this...i notice a lot of notes here talk about the ST,STe,STf,STfm,MEGA,STT,TT and lots of other stuff...i need to find out what they all mean...what would i need (minimum) to run the NOTATOR software?

please response via email if possible.

thanks for all your time,

simon ;)

In article <1992Jun16.230700.16123@ucsu.Colorado.EDU>, chuj@horton.Colorado.EDU (CHU JEFFREY) writes:
: >running other software emulations on a 030 to emulate PC, you only get the
: >performance close to a XT. My 030 using the emulation of EGA only emulates
: >1.6 - 1.8 Mhz XT speed.
:
: Made a mistake, I meant 1.6-1.8 Mhz AT speed which was still unuseable, an
: XT turbo 10 mhz is at 3.4 AT speed to give an idea.

STOP: The emulation is mainly very slow cause it has to translate
all accesses to EGA video memory. On the other side, GEMULATOR hasn't
got to translate accesses to ST video memory: instead of calling ST Roms
graphics routine (that are not very fast), it calls PC specific
routines: Gemulator has no overhead on Graphics. Drawings (alone)
should be as fast with Gemulator as with PC software ! That's
the good part of device independence !

6560. STDCAT 5.1 problem...

Newsgroup: comp.sys.atari.st
Date: 1992-06-19 10:59:32 UTC
From: hjv@phil.ruu.nl
Message-ID: <hjv.708951572@groucho.phil.ruu.nl>
Source record: 220707

Hello everybody,

Yesterday I downloaded the new STDCAT v.5.1 from a.a. It's packed as an
ARC archive, but I didn't manage to unpack it. I use ARC 6.02, which is,
as far as I know, the latest arc-version.
Has someone else experienced the same problems? Is the archive damaged,
or is there a newer version of ARC (with another compression algorithm
maybe)? BTW, STDCAT is in the atari/new(s?) directory of a.a.

Thanks in advance for any help,
Hendrik Jan

6561. Gulam and french keyboard

Newsgroup: comp.sys.atari.st
Date: 1992-06-19 13:07:07 UTC
From: maraninx@imag.fr
Message-ID: <35868@imag.imag.fr>
Source record: 220708

Does GULAM do something particular to control the keyboard ?
I have a french keyboard Atari-st. When I start GULAM, I have the
english mapping, until I press SHIFT/HELP.
Then, each time I run an editor or another program, and exit it,
GULAM has the english mapping again.
I have problems with the binding of arrow keys too.

Is there a configuration file, or something like that ?

Seeing viri used as a plural of virus really grates. The Latin plural of virus is virus. The English plural of virus is viruses. Viri would be ok as a joke, but viruses aren't something I like jokes about. I've been crying about this for hours, could I have a handful of Kleenices?

Steve

6565. Atari TT030 for sale

Newsgroup: comp.sys.atari.st

Source record: 220706
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech,misc.comp.forsale

In an attempt to get some cold hard cash, I need to sell my TT.
The package includes:

TT030 Computer w/ 4MB ST RAM
50MB internal hard drive
PTC1426 color monitor
Cordless mouse

All for the low asking price of $2000.
If you are interested, make me an offer.

Besides the above, you get all the other TT features like VME, LAN,
multiple serial ports, higher rez, etc.

Nonononononono. What are you talking about? Where did you get this
garbage from?

>structure of the 040, I mean how one gets from a 030-33 to a 040-33, but
>if its not near what Intel did, we should expect to see performances
>of the 040 at same clock speed as the Intel to be faster. This may support
>what some has already stressed, but I just wanted to make it clear that
>not all of us here are wrong.

Well you definitely are...

The 030 and the 386 have an internal divide by 2
clock. IE: for every 2 external cycles 1 internal cycle is executed. The
486 DX has a 1 internal / external cycle ratio. (040 is the same)

The 486 and 040 have been designed to be "almost" able to execute 1 instruction
per cycle. Whereas on the 386 / 030 it is usually 2 - 4 cycles for
code being executed out of the cache.

IE: the "4" chips (note chips alone not external hardware) ahould be more than
2ce the speed of their "3" counterparts. And they ARE. Period.

My ex-030 sun @20MHz was aproximately as fast as a friends 386i@25MHz.
Neither of them come close to a 040 station or 486 Unix box at 25MHz.
We measured both integer and fp performance. If I still have
the figures I'll post them.

6568. Literatur program wanted

Newsgroup: comp.sys.atari.st
Date: 1992-06-19 15:26:32 UTC
From: kruel@wpcst1.phys-chemie.uni-wuerzburg.dbp.de
Message-ID: <H.29kO5v8wmHU@wpcst1.phys-chemie.uni-wuerzburg.dbp.de>
Source record: 220726

Our group is looking for a _good_ literature program for the ST/TT. We have
the following wishlist:

- maintain database of sci. articles
- import/export functions
- interface to BiBTeX, if possible (helpwise to REFER).
- adding/sorting, generation of keys, checking for double entries, etc.
- GUI interface

This sounds pretty simple, but we haven't found _any_ useable program. We
have REVIEW 1.0 from Joerg Peters, but it's terribly slow and crashes often.
I don't know if 2.0 will be any better (GFA Basic, uurgh :-(

I don't know if Adimens would fit our needs.

Bibcard for Un*x is exactly what one wants, so I'd like to ask you if there
is something roughly equivalent for the ST (CiteCard from A.Tenud might be
such thing, but seems to have stopped in development).

We'd also take commercial software up to $500.

Thanks for any hints,
Thomas.

>> but the reverse operation is apparently available. Does anyone know
>> more about this?
>
>Could you be so kind to be more specific?
>
>1. What's the name of the program? Path on ftp.uni-stuttgart.de?
The program was found in a file called macexch.arc. I think that I was slightly deranged when I wrote my posting. I am now unsure where I obtained it from (I think it must have been from a bbs). As soon as I can find the file on the mess of disks I have, I'll post it to the binaries newsgroup and let everyone know (I have had several enquiries).
>2. On what system does it run?
I have no idea, as I never really bothered to test it out. When I transferred the file I hoped to transfer some Mac sound samples to my ST. The program I had transferred from ST to Mac. Upon receipt of a shareware fee, other programs would be made available.
>3. What disk recording formats/densities are supported?
I think it was 720k/800k. It was definitely not HD disk format.

Hope this clears things up. I will place a posting when I find the .arc file.

Jared Quinert
i921652@redgum.ucnv.edu.au

PS You're welcome to look on stuttgart ftp site if you want. It could be there for all I know. It isn't easy looking for a specific file there.

6572. WordPerfect 5.1 Update

Newsgroup: comp.sys.atari.st
Date: 1992-06-19 17:53:09 UTC
From: heidelj@alleg.edu
Message-ID: <1992Jun19.175309.9956@pellns.alleg.edu>
Source record: 220714

Well, I just spoke with the people at WP and I got two different answers. One person told me that she had heard that they were thinking about updating the program and the other person told me that they stated in January that there would be no more updates because of the lack of demand for the software.....I think that it would be worth the effort if people did decide to write to WordPerfect Corp. and let them know that we do want an update. It can't hurt to try.

| Then, each time I run an editor or another program, and exit it,
| GULAM has the english mapping again.
| I have problems with the binding of arrow keys too.
|
| Is there a configuration file, or something like that ?

The keyboard tables are within Gulam itself. I modified mine to get quote and backslash characters working properly. You need to search through the program for 'qwerty', and you will find the key tables. They are given as a continuous string of characters, indexed by the scancode values. Use a binary editor to swap the letters around within the tables and it should work ok. There are 3 tables: Unshifted, shifted and caps (not necessarily in that order).

Ah, I guess I don't know as much of the internal workings of my 486 as I thought I did, so I guess there is a tremendous amount of difference.

Yes Pete, thanks for pointing out that I was wrong here, but then again I originally did support the speed of the 486 from my original topic.

Before anyone becomes confused by this, you shouldn't directly compare TT performance to Suns, because Sun never built a burst-mode memory subsystem for their 030 machines. If you're curious about TT performance, benchmark a TT.

Excuse me... For WHAT? Like a good article in a SunWorld magazine said, you don't need 150MIPs for word processing. Although my 8Mhz 68000 is a little slow (for running several programs at the same time ala MultiTos), it still has enough power to control 1.3Mbyte/sec disk transfers, etc. A 50Mhz '030 is plenty of power for the majority of the users out there. I suppose a Sparcstation 10 with four SuperSparc processors is also to slow as well, right???

Source record: 220720

I upgraded the memory in my 520STFM to 2.5 meg using the Xtra RAM delux board. For most cmoputers there is no soldering required as it comes supplied with a 'piggy back' pair of boards for the MMU and Video shifter. If the MMU is soldered to the board you may need to de-solder that but otherwise they will both go piggy-back with no problems. The advantage with the Xtra RAM Delux is that it uses simms (same as the STe) so upgrading it is easy later on.

David Ford	To err is human but to really cock it up takes
dford@cix.compulink.uk	a computer operator.
Another Englishman :-)	Practice safe sex, as often as possible :-)

Just a note of correction, the MMU is never soldered to the motherboard,
as it is designed for a socket. It may be possible that the video shifter
is soldered in, but in my experience this is always socketed also.

For you electronics whizzos, what is the proper name for the packaging
of the MMU chips. I think it is PGA, but I might be wrong :)

The main reason the programmers "cripple" their software is to ensure that they GET paid for it. If they send out a full working version and people use it and don't pay for it that, IMHO, is stealing, but alot of people do just that. When you send out a crippled version and they like it, they pretty much HAVE to send in the money to get the rest of it. It isn't to be annoying, but to make sure they get money for the program(s) they make!

I agree, it's not quite shareware, but it's not exactly Demoware either.

I've used what sounds like the same program, I got it off of
atari.archive. What it does is makes a 720K HFS disk in MFM mode, which
Macs with High Density drives can read. The program will take a Spectre
formatted disk and transfer it to Mac disk.

Later.......

6588. Mint programs ???

Newsgroup: comp.sys.atari.st
Date: 1992-06-20 19:58:52 UTC
From: leonp@cs.kun.nl
Message-ID: <1992Jun20.195852.15087@sci.kun.nl>
Source record: 220737

I'm new to Mint.
I rather like its concept however, but I'd like to now
what programs are recommended to use with mint.

I know that these should be tos programs to be run as a background
process.

So Mint users out there. What programs are available for the
following things:
- command line shell
- editors (I appreciate small easy to use ones)
- terminal programs, this is really important for me
- others??

At the moment I owe a 1 meg 1040, tos 1.2
This will be changed however to a 4 meg 1040, tos 2.06 within
a few months.
Will Mint work with tos 2.06?

Thnx for any usefull information ....

Leon.

>the speed at which the processor was running (25MHz I believe, though
>I could be wrong). [stuff deleted] It's not the processor speed
>which is the bottle neck these days it's the peripherals and the internal
>architecture which determines the speed.

I'm sorry, but the NeXT Cube (030) is a poor machine to determine
the value of the 030. What killed the speed of the Cube was not the
optical disks (which mainly affected cold boot time as the OS was
loaded then, and most Cube owners did not turn off their Cubes often).
Fast hard disks were used more for normal storage. What *really*
slowed down the Cube was Display Postscript. If you thought that
Postscript laser printing required a lot of processing power (and
time), then think of what updating a 19 inch Postscript display
requires in processing power.
I never played with a 040 NeXT, but my understanding was that the
Display Postscript knocked the 040 down to almost the speed of an 030
in terms of real applications.
Architecture and design certainly has a lot to do with speed. The
030 in a TT doesn't mean that the TT is slow. Speed is all relative
anyway. Most people would agree that and 030 is faster than a 386 and
an 040 is faster than a 486. So what. What really matters is that
you like the machine you own and the applications you need are
available for it. This is, IMHO, a more valid test of the value of a
machine to an individual rather than it's specs.
My roomate just spent about $15k on a Quadra with a nice video
board, 19" monitor, 64 meg ram and 1.2 gig drive (and software). He
doesn't need it, he just wants bigger-faster-better. Sure it's nice,
but he is still impressed with some applications on my "lowly" 2.5 meg
no hard drive (ouch), vintage 1985 ST as am I. I could use a tad bit
more speed and graphics after almost 7 years, but I'm happy with it.
Whether the TT is a value or not does not rest on it's speed but
it's software. The first Falcon won't be anywhere near the speed of
the TT. But it will probably also lack software that takes advantage
of many of it's exciting features and thus may not be as great a
value to begin with.

last night i ported GNU bc v1.02 to the ST. i uploaded the binaries to atari.archive (bc102b.zoo in ~ftp/atari/new). included are manpage, .ttp, readme's, and math library source. and of course the ubiquitous "copying" file. compiled with GCC 1.40 with MiNT libs at PL 19. stripped the .ttp.

will post the source or diffs later next week, probably as bc102s.zoo.

in a nutshell, what was done to the original GNU distribution was:

- run "configure" on a 4.3BSD/POSIX system to gen makefile, config.h
- modify makefile (used flex v2.3.7 so lex.yy.c->lexyy.c and used bison v1.14 so y.tab.c->y_tab.c and y.tab.h->y_tab.h)
- discard *.dist files (ie use *.y and *.l)
- change scan.l:

```
#ifdef atarist
#include "y_tab.h"
#else
#include "y.tab.h"
#endif
```

and changed

```
[ \t]+ ... to [ \t\r]+ ...
```

so that carriage returns are also ignored making it possible to read files with either newline or cr-nl terminated lines
- tweak manpage (renamed from bc.1 to bc.man) a bit, generate bc.1 for manpager
- make (compiled with libmath.b->math.h as distributed, ie with library internal to the code if invoked "bc -l")

see readme.st and manpage for more details. original src is available as prep.ai.mit.edu:~ftp/pub/gnu/bc-1.02.tar.Z.

enjoy...

Good question. There is a PD program called SPECGIF4 made by Trio
that converts .SPU and .SPC pictures (.SPS not supported) to
320x200x256 GIF in either interlaced or non-interlaced format.
Conversion takes under 10 seconds. It is not on atari.archive as far
as I know. I could upload it there if it isn't.

6596. Re: ST/STE/STF/STFM...arghhh!!!

Newsgroup: comp.sys.atari.st
Date: 1992-06-21 01:21:30 UTC
From: Steven.Wells@bbs.actrix.gen.nz
Message-ID: <1992Jun21.012130.22273@actrix.gen.nz>
Source record: 220740

The only ones that you would be interested int are:

STFM
STE
Mega STFM
Mega STE
TT030

The rest are pretty-much obsolete, (or at least un-available on todays market)

You'd be best to go for a 1040STE.

Runs at 8Mhz, and has 1meg of RAM. It'll quite happily work with
Notater, and has advantages like a Blitter Chip for high-speed data
shifting, a 4096 colour palette, DMA (Direct Memory Access) chip for
high-speed, and high-quality sound & memory access. it'll happily
play music at up to 25Mhz (and higher, but that's the standard)

The Mega STE is the same, but it's faster (16Mhz) - and has a different
desktop with more features. not really necessary. (But it DOES come
with a Hard-Drive!!)

The TT - is much more powerful, with a 32Mhz 68030 processor, and a
maths co-processor to speed things up. It also has everything the STE
has, but can display 256 colours on screen at once. It also has
6-graphics modes, including VGA-type resolutions.

Basically, all you need for everyday home & music use, is a 1040STE,
and then buy some SIMMS (Single, In-line Memory Modules) and upgrade
it to 4megs'.... This should keep you happy!

m> the TT at all.

Then you've never tried using one. I run a fidonet point on it,
word-process a bit, but mostly code - and _that_ is where it really shines.

M> If You need < Insert student's standard wishlist here >,
m> which includes
m> Unix, X-Window, *good* graphics & sound, SCSI; the average person
m> would choose an '486. The 68030 ist *just too slow*. (look at the
Next030,
m> even the 040 is to replaced by an 88110).

Umm, well as far as comparitive application tests go, my TT seems quite
capable of holding its own against ye average 486 - that's TOS/DOS
comparisons - I don't have ASV so I can't make ASV/ESIX (or whatever)
comparisons.
The NeXT 030's big problem is a top-heavy operating system - X on the TT is
reputedly quite snappy.

***** Announcing a worldwide boycott/riot of Windows *****

As learned peoples, we have the obligation to save our planet from
the utter waste of sand-cum-silicon perpetrated by Microsoft Windows
and their by-products. Therefore this boycott/riot (to last until
January 1, 2001) is necessary and just. Dei gratia et ventis secundis,
magnae spes altera atari.

So go forth and never forget our motto: Break like the WindOS!

The STFM is also obsolete and hasn't been on sale for some time now.

>You'd be best to go for a 1040STE.

Not really. I would buy 520STE ready upgraded to 2Mb - slightly cheaper
and twice the memory. However, you do get some low end software packages
free with the 1040STE, but done of them good enough for serious work.

>Runs at 8Mhz, and has 1meg of RAM. It'll quite happily work with

There is a hard drive option which costs as much as a stand alone hard
drive for a 520STE.

>

>maths co-processor to speed things up. It also has everything the STE
>has, but can display 256 colours on screen at once. It also has
>6-graphics modes, including VGA-type resolutions.

The graphic modes on the TT are not as good as typical VGA cards.

>Basically, all you need for everyday home & music use, is a 1040STE,
>and then buy some SIMMS (Single, In-line Memory Modules) and upgrade
>it to 4megs'.... This should keep you happy!

If you do this you will have to throw away 1Mb of old memory chips (they
are not worth anything anymore). You might as well get the 520STE which is

less than 3/4 of the price.

If you are willing to wait the other computer you might consider is the Falcon. The latest rumours are that it will be powered by a 16MHz 68030 (3-4 times the speed of an 520STE) with a powerful DSP chip that is twice as powerful of as the 68030 and suitable for high speed graphics and sound co-processing. The machine is said to have 10 channel 16-bit stereo sound with built in 16-bit digitaliser. Rumours about the graphics are less precise, but it is meant to be better than the TT's. Apparently it will be available late this year and cost about twice as much as a 520STE.

Is anyone aware of whether the Athena CAD program is still available?
Some years ago, I helped a friend set up an ST for his business and
we bought Athena after comparing a few reviews. He's since sold his
computer (with all the s/w). Now another friend wants to start using
his ST in his business to design landscapes and other plans. I recall
reading about an upgrade (Athena III maybe?) a long while ago but
haven't seen any ads for at least a year. Was there an upgrade?
If so, anybody got one they'd be interested in selling?

Thx.

Hi, does anyone here know where I can get an English version of the German Virus Killer `Sagrotan'? Please reply via Email as we're not properly receiving this newsgroup.

Thanks,

-Conan.Ford@Debug.cuc.ab.ca

6618. 640*800 screen resolution

Newsgroup: comp.sys.atari.st
Date: 1992-06-22 02:41:16 UTC
From: azog@thoth.rent.com
Message-ID: <1992Jun22.024116.19230@thoth.rent.com>
Source record: 220561

I found a program the other day, called DOUBLE2, that lets me make
the screen twice as large (from 640*400, to *800), in two ways...

One is to scroll the screen up and down with the mouse (STe only)
The other is to actually double the screen height.

When I run it the second way, it flickers horribly. What I would like
to know, is there a monitor I can run thatll stop the flicker? Ive
been considering getting a multisync for some time now, and if thatll
stop the flicker, that basiclly settles the question.

One other thing... Its interesting to note, that GEM programs, run
under the higher resolution can handle it. Even the desktop can.
I dunno what it means, but it sounds like good programming to me.
Even NeoDesk can do it, but complained about no defaults the first
time... (I saved the defaults as NEODESKS, the S for super :-)

Thanx

Sorry...but that's only the half truth. Well, maybe he has got much
luck and got a TT with a _very_ good WD-1772-02-02 (floppy-chip), but
the most TTs do _not_ work correctly with a HD-Ddrive.

But one thing is right: first try to use the HD-Ddrive without any
AJAX-chip. But if there is any serious trouble, try to get the AJAX.

Roland.

Hi Tony,
I don't use midi myself, but since noone else has answered (maybe because it's still the weekend in the states even though it's Monday night here!) There are a few shareware programs around, also, there was the "Sequencer One" (sp?) on a ST Format coverdisc about 1/2 a year ago... you might be able to get someone to sell you their copy of the magazine with the disc (I believe it is still a commercial package even though it was distributed with the magazine?)

6624. Mouse

Newsgroup: comp.sys.atari.st
Date: 1992-06-22 08:21:03 UTC
From: shore_c@kosmos.wcc.govt.nz
Message-ID: <1992Jun22.082103.8279@peponi.wcc.govt.nz>
Source record: 220620

Ok, my poor little mouse cord is dying, the left hand button quite often
won't go, but a little movement of the cord fixes the problem. :-(

I might go out and buy a new plug & cord (since the plug is moulded onto
this one), but I thought I might check out what you lot thought of
an alternative mouse first.

The mouse i've got is actually quite a decent one compared to a lot
of the Atari ones i've used. Mine seems to roll around quite nicely
etc.

So what alternatives are there? What is the price like? What are the
mice like? I've seen the "Beatle" one,.. how does that rate?

Thanks,
Craig.

From: gti17@eva.informatik.uni-dortmund.de
Message-ID: <1244ujlNNhqv@fbi-news.Informatik.Uni-Dortmund.DE>
Source record: 220617

Hi folks,

as the subject says I'm looking for the email adress of Jens Pirnay, he
is the author of TeXDraw for the Atari ST.

I tried the email adress given in the manual of TeXDraw 1.71 it was:
pirnay@vax1.rz.uni-regensburg.dbp.de but my email prog says 'host unknown',
so I think this adress isn't valid anymore.

Just in case Jens is reading this:

I saw TeXDraw on an Atari and now I want it for my Amiga, because there isn't
any program on the Amiga with all the features of TeXDraw. So I've got two
questions:

1) Is there already an Amiga version of TeXDraw (if yes: where do I get it ?)

2) If there is no Amiga version: Is it possible to get the sourcecode
anywhere ?

Thanks in advance
Christoph

You can buy the cords here from (Atari), and one type of button swiches from D.J Reeds..

Well Light Speed did a good cheap one, $50nz it was the same as the first version of the Golden Image one, this is the version that I am using, Kmart here sells the Golden Image II one for $60nz from memory...

It has a switch for Atari/Amiga uses..

6629. WINX - still only 4 windows in desktop

Newsgroup: comp.sys.atari.st
Date: 1992-06-22 10:41:04 UTC
From: minidis@urz.unibas.ch
Message-ID: <1992Jun22.104105.26694@urz.unibas.ch>
Source record: 220616

Hi,
I am using WINX on my 1040STFM (4MB), TOS 1.4 (or rather 1.04).
I installed it with 16 windows. Works fine with most gem-progs that
use windows, but in the ATARI-DESKTOP I still can open only 4
windows.
I also use TOS1.4-FIX (or however it is called); I first
run WINX, then TOS1.4-FIX as one is told in the readme-file of WINX.

Is everything the way it is supposed to be (still only 4 windows in desktop),
or do I have to change something ?

thanks in advance,

> Prolog-68... BTW, will there be a version of Prolog-68 which can create
> an executable file?

Maybe.
I tried to make a `dumped' version a la GNU Emacs, but that won't work due to the data-structure layout I'm using (in case you're interested, I have to rely on all data structures being 4-byte aligned. TOS only guarantees 2-byte alignment when loading executables).
I could try to pack all the preloaded stuff into a single file and append that to the executable, but at the moment I'm occupied with something else (making Prolog-68 more compliant with the draft ISO standard, among others).
I've also taken up a full-time job ...

Greetings,

Jens.

This is normal. The desktop of TOS 1.04 doesn't support more than four
windows. This applies only to the desktop, not to other programs, of course.

6633. Mouse port

Newsgroup: comp.sys.atari.st
Date: 1992-06-22 11:30:31 UTC
From: wilesaj@uhura.aston.ac.uk
Message-ID: <1992Jun22.113031.3382@aston.ac.uk>
Source record: 220624

Does anyone have any information about the mouse ports on an ST.
I'm trying to connect an analogue joystick to my STe, to replace
the mouse for flight sims etc. There are two options, connect it
the analogue port and write a software patch, or build a hardware
device which converts the pot resistances into a pulse train like
the mouse produces.

The second is more likely as I don't know if there is any way of
intercepting reads to the keyboard processor, and anyway most games
would probably object to a software patch. As regards the hardware
solution, does anyone know what sort of frequencies the ST mouse
produces?

Any comments appreciated

Adrian

No chance. The number of windows the ATARI-DESKTOP uses hasn't anything
to do with the number of windows AES support.

Use gemini (or something else) instead of your desktop.

>or do I have to change something ?

I think the problem is caused by the desktop itself. WINX is supposed to increase the number of windows that GEM can use, but this is no good to the desktop since it was written with the 7 window limit in mind, and so was hard-coded to only allow 4 file windows, leaving a few spare for accessories. The answer is hack your ROMs, or to use a desktop replacement such as Gemini or Neodesk.

It depends on how fast you move the mouse. Try moving the mouse and count how many pixels it moves on the screen. One pixel is one pulse from the mouse.

Not mine, my '89 TOS 1.2 STFM had it soldered in so I had to solder a socket
ONTOP of the shifter, then the push-in sits in that (it took about 2 hours and
a 50p socket)

6641. ST BOOK, MULTITOS?

Newsgroup: comp.sys.atari.st
Date: 1992-06-22 13:57:28 UTC
From: dhbutler@magnus.acs.ohio-state.edu
Message-ID: <1992Jun22.135728.22115@magnus.acs.ohio-state.edu>
Source record: 220636

Just wondering what the status of these two "products" (really just 'ideas' at this point I suppose, since we have not actually seen any *produced* yet) is. I am interested in the battery life of the ST BOOK, the Powerbook is lucky to get 4 hours (usually 2.5) if you are *really* careful, the ST BOOK sounds like it should get about double that in general. Multitos sounds *extremely* nice.

SO:

Do either of these things actually exist?

Will they ever be PRODUCED?

Anyone from ATARI out there?

6644. New Version of BASH (1.12)

Newsgroup: comp.sys.atari.st
Date: 1992-06-22 14:56:12 UTC
From: skolodzieski@vaxc.stevens-tech.edu
Message-ID: <1992Jun22.095612.1@vaxc.stevens-tech.edu>
Source record: 220637

Hello,

It seems that with the arrival of summer and all, my latest port of BASH,
(Version 112 with UNIXMODE extensions) has got stranded forever in the
/atari/new directory on atari.archive.umich.edu. So if you like you can
fetch it from there, the three releven file names are:

112src-d4.zoo - diffs to make source code.
112bin-d4.zoo - complete binary distribution.
112doc-d4.zoo - a Nice LaTeX document describing
this port of BASH on the ST/TT

Note that the doc file is include in the binary and source
distributions also, but has been made available seperately
fo those who are unsure what bash is or are unsure if bash
is for theme.

Also since the atari/new directory is really only for incoming
files, you cannot do a directory of it ro do wildcard get's from
it. Nevertheless if you know the file name you can retreive it
individually. Remeber binary mode for these zoo files.

Highlights in 112-distribution 4:

1. Fixed bug that caused terminal to hang on heavy readling
editing input.
2. External executable file referances now work much better
from scripts.
3. Functions that call external programs do not hang.
4. Slightly smaller and faster.

Cheers,
Scott Kolodzieski...

You are correct. There is and will be no 5.1 for Atari. This type
"news" has been posted previously in Atari pubs recently. It seems
more wishful thinking or and attempt to get Atari users to flood
WP in hopes of a favorable reaction. I have called WP (and was even
a 4.1 beta site way back when for WP on the Atari. Put simply...
forget it!!

Either I've totally lost my sense of humor, or it's just the lack of
a smily in the last posting. As early as a couple years back it seemed
fairly common knowledge (from semiconductor conferences, etc) that
Moto had no 050 or subsequent follow-ons planned. Does someone
(say, Steve Jobs?) know differently? That seems why Sun went SPARC,
Apple is going PowerPC, and NeXT is unsure just WHAT to do.

6648. Atari ST -> Commie 1084 monitor

Newsgroup: comp.sys.atari.st
Date: 1992-06-22 16:30:13 UTC
From: cs902117@juno.ariel.yorku.ca
Message-ID: <1992Jun22.163013.26809@newshub.ariel.yorku.ca>
Source record: 220556

Hi all! Thanks to Ben Gilbert, and some spare time on my hands, I managed to put together a monitor cable to hook up the ST to my Commodore 1084 monitor. I have run into a small problem with it... I hooked up everything the way it should be, and there was nothing on the screen. Then I accidentally wired up a pin labelled "monochrome" to a color pin (Blue) and the cable now works, BUT, I don't have BLUE!!!!

The 8 pin digital RGBI input looks like this (from Commodore manual):

```
2 .
4 . . 5
8 .
1 . . 3

6 . . 7
```

1. Not Connected
2. Red
3. Green
4. Blue
5. Intensity
6. Ground
7. Horizontal Sync.
8. Vertical Sync.

The 13 din pin connector (listing only those connected) for the ST is as follows:

```
4* 3* 2* 1* 1. Audio Out
8* 7* 6* 5* 6. Green 7. Red
12 11 10 9* 9. Horizontal Sync. 10. Blue 11. Monochrome
13* 12. Vertical Sync. 13. Ground
```

(pins 1 and 5 from the 8 pin connector for the monitor are not connected)

Any help on how to get blue back into the picture would be appreciated!]

>As you see, it's no problem to get sources for lh5, so I can't understand
>why some people are always saying the .LZH files cause problems.

It IS a problem to get sources for lh5! Of the off-the-cuff sources you've mentioned in this article, I was unable to come up with a single, verifiable version of LHARC source code which incorporated the -lh5- format.

The problem with .LZH files is this: I cannot dearchive on the machine I have (in this case, a VAX/VMS system) in order to determine whether the archive contains anything useful for further download. (At 15 megabytes a month worth of archive files, I want to be choosy about downloading at 2400 baud!)

>Take any
>LHArc-Version 2.01l and you will be able to extract EVERY LHArc archive
>created by whatever program on MS-DOS, Unix, Amiga or Atari.

Good. Please provide an executable of LHArc-Version 2.01l which works on a VAX/VMS system, so that I can make use of the power of this version on the system which connects me with the Internet.

>It's also no problem to get the sources

It's a problem. The source is not available in the /unix directories on atari.archive.umich.edu. The Archie server lists any number of lharc directories, most created in 1990 or early 1991, NONE of the first 200+ listings contain a '2.0' version capable of dearchiving -lh5- archives. The only 'Amiga'-related directory found in that search carried a copy of lharc version 1.0.

LHArc 2.xx may be better than Zoo 2.1, but the archives produced with LHArc are certainly not as portable across platforms.

You are right that it would be difficult to write a software patch. The reasons for this really belong in .tech, however it is possible and in general flight simulators tend to be more patch friendly than other games.

As for the second solution I think the Gravis Mousestick does exactly what you suggest. They advertise in at least one of the British ST magazines. The device apparently works very well, but is quite expensive.

>in the money to get the rest of it. It isn't to be annoying, but to make sure
>they get money for the program(s) they make!
>
>I agree, it's not quite shareware, but it's not exactly Demoware either.

The point is exactly this -- a 'crippled' demo of a sub-commercial program IS 'demoware'. It is definitely NOT 'shareware'.

Shareware (noun) - A fully working program, including documentation, which is freely distributed to computer users in the hope that those users will find the program valuable and, thus, send money as compensation. In general practice, it is useful to offer a program with a few more 'features' as an inducement toward payment. In some cases, the source code for shareware is offered for an additional fee. In rare practice, the shareware 'fee' is minimal --- a request for a postcard from the user, for example.

Demoware (noun) - A crippled program, sometimes including documentation, which is freely distributed to computer users in the hope that those users, being frustrated with the unusability of the demo program, will send money in the hope of obtaining a fully working program. In general practice, demoware generally imposes (1) time limits on the working of the program, after which the computer may need to be reset; (2) lack of a 'save' feature for data and/or configuration files; (3) lack of a 'print' feature for data output; (4) incomplete data output when using a 'print' feature; (5) annoying alert boxes after the execution of every command. Freqently masquarades as 'shareware'.

Demo program (noun) - A clearly labelled, limited demonstration of a commercial program used to acquaint the purchasing public with the features of said commercial program.

Demo (noun, slang) - A fully working program, or series of programs, which usually provides graphics and music in a format meant to impress the person running the program with the limits to which the programmer(s) can take the hardware and software of the particular machine for which the demo is designed. When they are good, they are really really good. Bad demos don't generally get distributed to the general public. There ARE differences in taste among the public. For example, this writer is not impressed with gratuitous violence in demos.

Freeware (noun) - A fully working program, including documentation, which is freely distributed to computer users. No recompense is required, although the author may provide an address for bug reports and/or a general "thank you" note. In some cases, the source code for freeware is offered for a minimal fee.

Public Domain (noun) - A program which has been released to the public without copyright, and for which all rights, including the rights to limit changes to the program or prohibit commercial use, are waived. Sometimes used (incorrectly) to cover the whole range of freeware to shareware.

Some other programs inforce a limit to the number to windows to insure that there is always windows free for desktop accessories, so this does in fact apply to some other programs.

Yeah, a PGA is PIN Grid Array. It has pins sticking down out of the bottom to
fit into a socket or solder into holes in a PC board.

PLCC is Plastic Leadless Chip Carrier which causes me confusion often because
an LCC package is Leaded Chip Carrier (has leads)

PLCC's can be solder directly to a board using surface mount technology.

The Messe is at the Duesseldorf Fair Grounds bldgs 11 and 12. You can't
miss the fairgrounds, all roads lead there <grin>. Last year many signs were
posted everywhere on many roads. Hours are 10.00 to 18.00

One can call for more info: (in Germany) 06142/209-0

Actually Building 13 where the Multimedia Systems Group was until about a
week ago suffered from a side effect of a similar problem. Do you remember
the movie Poltergeist where a suburban family is terrified by horrible spirits
from the beyond because some sleazy real-estate promoter built their sub-
division on top of an old graveyard without removing the bodies? Well
the vengeful souls of all of the 64K CGA IBM PCs that were buried beneath
Building 13 recently surfaced and drove everyone out. "Theeeyy're baaack..."

Hmm.... I think that the building's now going to become an extension of
the executive briefing center.... :-)

Umm... when did this happen ? I can get more than 4 file windows open
at the same time on my MegaSTe and the same was true for my old
1040STf w/TOS 1.2. I know I can get MORE windows from TOS 2.05 than
1.2 but the exact number escapes me.... (7 for 2.05, I just checked)

But who needs that many windows open at the same time ? The ST is not
like a mac where each sub-directory (ie. folder) opens into its own
window on the screen. Changing directories on the same drive is very
easy on an ST so there is really no need for so many file windows open at
the same time.

<diagrams deleted>

Well, it sounds like (corect me if I'm wrong) you didn't connect the
monochrome detect line (pin 11) to either 0/vcc. I'm not sure about this, but
I believe that it _does_ have to be connected to one or the other or the ST
doesn't know whether you have a color or monochrome monitor attached. I think
that the line is active low, so you want to tie VCC to pin 11 and put the
blue line back to the blue line (st->commie). That way the ST knows that
it is connected to a color monitor.

>Any help on how to get blue back into the picture would be

>created by whatever program on MS-DOS, Unix, Amiga or Atari.

Well, thre's no reaon I should take it personally, as you've just
backed up my question. I personally have no problems with -lh5- compressed
files, and find it easier than zoo, though the person who pointed out that
cd'ing to the destination directory would work well. Zoo, on the other
hand, broke beteen the latest version and the last with the commands a
program I was useing to extract anything. This program doesn't have enough
space in the tedinfo field to take the "novice" commands, so it's back to
the hard way. I've been playing with writing a script that creates basename
as a folder, cd's to it, then calls zoo, but have yet to find a good
basename clone.
Anyway, my point was that anyone who really wanted to could get the
sources and convert them, if they tried. Personally, I like the increased
speed of -lh5- as it seems to work well in the cache of my accelerator.

>
>It's also no problem to get the sources (well, currently there semms to be

6668. :) 64MB of TT-RAM in my TT :) :) :) (no joke!)

Newsgroup: comp.sys.atari.st
Date: 1992-06-23 07:46:37 UTC
From: rdjeline@faui09.informatik.uni-erlangen.de
Message-ID: <BqAG9p.JEE@immd4.informatik.uni-erlangen.de>
Source record: 220589

Hi all ya ! (TT Wizards)

Well the price and that it works I posted in comp.sys.atari.st.tech !

Now the Question: What should one do with such amount of memory ?

Don't forget MultiTOS. The more memory you have, the more Applications
you can run. Calamus itself, needs (fully uploaded here 20MEG) mem.
Can you imagine the whole Pure C System on a FAST-RAM Ramdisk ?
YOU CAN'T (believe me). The ridiculous 512KB needed for speeding up
the OS (RomRam) (really ridiculous).
Outside - VRam - whats that :) ? Don't need it any more. Did you ever
see Kobold with 30 MEG for his own ? Puuh !
Well and a small 2MEG Cache for the Gemdos and Folders should help
your System with its 10 Terra Hard-Disk :) .

I see the TT is just good for Games - like all ATARI-Stuff :)))

I always used the ATW for Space Invaders and Breakout.

Unix with 64MB (Well - Actually 74 (St-Ram)) ?? Without Swapping ?
All I can say: Cremedelacreme.

So long my dear Apprentices

Ciao

Atarico

PS: My Computer is intelligent !

6671. GNU-C 2.1 Compiler Problem

Newsgroup: comp.sys.atari.st
Date: 1992-06-23 09:51:52 UTC
From: kring@efes.physik.uni-kl.de
Message-ID: <1992Jun23.095152.10429@rhrk.uni-kl.de>
Source record: 220571

I have a problem with GNU-C 2.1. When I try to compile the file

```
#include <stream.h>

int main( void )
{
cout << "Hello world!\n";
return 0;
}
```

by typing

```
gcc -v -o test.tos test.cc -lg++
```

I get the following output:

```
gcc-ariST version 2.1 Patchlevel 2
d:\gcc\bin\gcc-cpp.ttp -lang-c++ -v -undef -D__GNUC__=2 -D__GNUG__=2 -D__cplusplus
-Datarist -Dgem -Dm68k -D__atarist__ -D__gem__ -D__m68k__ -D__atarist -D__gem -D__m68k
hello.cc d:/tmp/cc100000.i

Anyone interested in buying a slightly damaged Spectre GCR? It works perfectly with hard disks, and there's no problems with the emulation, *however* you can only access one floppy per session - the next time you insert a floppy and try to access it, the machine locks up. This may be fixable, I don't know. Since I ran everything off hard disk, I didn't notice this as being a particularly serious problem.

It comes with all leads and software, original manual and box, Mac roms, and the version 3.0 update. I'll stick system 6.0.5 and a few previous versions in with it as well. If you're interested, make me an offer. Bare in mind I'm in the UK though.

6675. Minix on the ST: Requirements? Performance? Supplier?

Newsgroup: comp.sys.atari.st
Date: 1992-06-23 11:31:00 UTC
From: J.Mullin@lut.ac.uk
Message-ID: <1992Jun23.113100.29662@lut.ac.uk>
Source record: 220573

Hi

The subject line says it all. Will Minix run on a 1MB ST, with 42MB disk space? What's the performance like? (using a SPARCStation at work can spoil you :-)

Finally, is there a UK supplier for Minix?

Thanks in advance

John

Wait for MultiTOS, then you'll know! How would you be able to run
20 programs at the same time (every TOS program in a window) if you
had only 7 windows (or 4 for that matter)? What if you wanted to
have a terminal program on the desktop (good ones can handle several
windows at the same time), edit some C-modules at the same time,
and run TOP or whatever? MultiTOS has been reported to have run
with 90 windows open at the same time BTW.

Well. It's on the 'Messegelaende' :-) I guess it will open at 10.00 in the
morning. You can take the 'U-Bahn' (underground) from the 'Hauptbahnhof'
(Railway Station).

>John Neubert

Well, I can attribute a source to this "rumor". In the last issue of the M.A.C.E. newsletter (Midlands Atari Computer Enthusiasts), there was a brief blurb saying that one of their members had recieved a letter ***FROM WORDPERFECT*** asking for input on the release of v5.1 for the Atari. Now, if this rumor is just that -- a rumor -- that means somebody somewhere along the line is blatantly lying. No accusations, just observation.

Personally, I sent in my letter. I mean, what harm can it do. Even if it is just a rumor, at least it lets WP know that there ARE people out here who would like to see it happen.

Hope this clears things up some (though it might just add to the fire).

I stand by this statement... I was refering to a very specific
instance of window usage. On the DESKTOP showing directories.

>Wait for MultiTOS, then you'll know! How would you be able to run
I am :-).... Right now, a program I've been working on is stymied by
two things.
1. How do you get it to behave in an environment such as Multi-Tos/Gem.
2. GEM itself....
Someone from Atari mentioned a few months back that programs that use
a lot of dialog/alert boxes aren't very GEM friendly in a multitasking
environment because they take control of the system when they are used
and you can't switch to another program until they are dealt with.
Once I can figure out how to do what I want in windows ONLY, I'll be
all set.
>20 programs at the same time (every TOS program in a window) if you

Isn't that a bit much for one person ? :-).

The only problem is memory. Does the ST use up huge chunks of RAM for
windows ? How much memory would you have left over after opening the
90 windows you mentioned ? On a TT there might be enough memory left
over to run a large application but on an ST where the max is 4megs of
RAM ?

I will be selling off my old ST soon, but before I do that, I would like to try something. Years ago, I bought Flight Simulator II, and I have enjoyed it very much. It has a modem option, to allow two planes on two separate systems to fly together -- I have a 2400 baud modem, and would like to try this just once while I still have my ST. I would like to hear from someone in the local Toronto calling area (I live downtown) who would like to spend an hour or so flying some evening -- I will be moving soon, so this will be a one-time deal.

Hello everybody

I want to find CAD softs which are :
PAD, SB-PAINT, STUDENT CAD, DISP, ATADRAW and ST DESIGNER.
Does somebody could tell me where I can find these softs ?

More over, I want to find games :
HEXTRIS, Monochrome TENNIS, SOLITAIRE (not the game card but the board game)

I have seen this softs in DOMPUB Magazine in French and I haven't seen the softs
in the network.

Could you hel me ?

If possible, please E-MAIL response

Thank you

There really is a problem with having such a wide variety of compression programs available. It has been a major hassle to try to keep up with the current newest. I like compression programs. I use them often, but I always make sure the recipient can handle the format before hand.

I recently became the publisher of our User's group Newsletter, and find that the people who lh, arc and zoo their articles don't EVER say what version was used to create it. If I have to call the person who uploaded the article to my bbs, then get the newer version, then un[pack|compress|lzh|...], I loose all the time saved by the original uploader.

It's even worse when I have needed to download a new version of ARC, LZ etc from Compuserve. That gets expensive.

Enough soap box. Many thanks to those of you who have taken the time to create and distribute the archivers and compressors.

I have the following complete system forsale. THE SYSTEM IS CURRENTLY
compatible with ST software, PC software, and is ready for MAC emulation,
and ATARI transformer. READS AND WRITES 720K PC/AT disks, and ST formats
also.

*ATARI 1040STfm with 1 meg RAM, 720K internal 3.5" Drive
With internal clock and calender, keyboard
anti-static pad, 9 pin extender for easy access, and
TopCase Cooling FAN (LOW NOISE) for the POWER SUPPLY
SPECS:
MC68000-8Mhz 32 BIT internal/16 BIT arch.
MIDI IN/OUT
RS-232 port, Parallel port, HARD DISK PORT,
Floppy Disk port, TV port.
ROM cartridge port
VIDEO RGB/MONO PORT
VIDEO card built in for low, medium, and high rez.
Emulates MAC with GCR 30% faster than the MAC
(GCR not included)

*BEST MOUSE (2-button oval shape) w/pad

*External 360K drive

*RGB color monitor ATARI 1124 w/ swival monitor stand

*External HardDrive Case with Power Supply (Ready for HD)

*about 400 3.5" 720K floppies with case holders.
Many titles that still have original boxes.

Such Titles as:

PC-Ditto software.
SPACE ACE
WAR IN THE MIDDLE EARTH
FIRST WORD
SHADOWGATE
BAAL
WAR CONSTRUCTION SET
OGRE
OBLITERATOR
THE PAWN
and more...

*BOOKS such as GEM programmers reference from ABACUS
MANUALS, MAGAZINES, AND ORIGINAL BOXES are included.

SEPERATE PURCHASE:
1040stfm w/ mouse etc.. ..... $250.00
monitor with stand $150.00
external 3.5" drive ..... $ 30.00
software ..... $ 10 - 25.00 each
GEM programmers reference manual $ 17.50

BUYER GETS EVERYTHING ... $600.00

EMAIL me if interested:

I think this goes back to a December 1991 message on GEnie from Bill
Rehbock, who said:

``Static Dialog boxes are bad, very bad, and really, really, really
irritate users on a multi-tasking system, because they generally
take control, and leave the user with no ability to get at their
other applications.''

Many others have pointed out that making dialogs modal is Atari's
choice, and not an unavoidable law of nature.

>>20 programs at the same time (every TOS program in a window) if you
>
> Isn't that a bit much for one person ? :-).

So is 20 megabytes of hard disk space. Oops, I mean 80. Or maybe I meant
to say 160.... :-)

> The only problem is memory. Does the ST use up huge chunks of RAM for

Mmmm. I can remember when the question was: ``Is 48K of RAM was enough,
or so I need 64K?''

I think that when MultiTOS shows up, it will be recommended for use with
the 68030/040 machines. In addition to the 4MB memory limitation, the
68000 can't protect memory regions from being stomped by wild programs.
All indications are that MultiTOS will run on the older machines, but
you'll have to live with their shortcomings.

Both of them.

> Will they ever be PRODUCED?

The ST-Book is produced. If you're interested in buying one ... :-)
There are only the books with 1M of main memory so far, but we're
selling them (German Atari dealer).

Multi-TOS is still in beta-testing. If you're an Atari developer you may
have a copy. It seems like it _will_ be presented as a product on the
Atari fair in Duesseldorf in late August.

Cheers, Paddy

> dud@u.washington.edu

If you just want GER2ENG to handle more words, you just have to expand its dictionary. However, if you want a translater which does a better job of translating, then you'll have to cough up real money (and probably buy a new platform to run the program on). From what I can tell, GER2ENG just does a table lookup on German words, substituting catalogued English words for them. It doesn't seem to do much (any?) syntactic analysis, and doesn't allow for any form of ambiguity. It doesn't even handle verb conjugations. The methods used would appear to be over 30 years old.

If you pay real money, you can probably get something which handles a fair amount of English and/or German, but don't expect a lot in the PD domain. Even programmes for which you pay substantial sums should be looked on more as aids for translators -- a `Translator's Workbench', if you will. This is, after all, a research subject.

If you're interested in machine translation in general, your library probably has lots of useful references -- some names to look for include Jonathan Slocum and Sergei Nirenburg. W.J. Hutchins wrote a book in 1986 which I believe was generally well received entitled ``Machine translation: past, present, future,'' but it will be somewhat dated now. There's also a journal on MT, but that's not my area, so I don't subscribe.

Even programmes for which you pay substantial sums should be looked on more as aids for translators -- a `Translator's Workbench', if you will. This is, after all, a research subject.

If you're interested in machine translation in general, your library probably has lots of useful references -- some names to look for include Jonathan Slocum and Sergei Nirenburg. W.J. Hutchins wrote a book in 1986 which I believe was generally well received entitled ``Machine translation: past, present, future,'' but it will be somewhat dated now. There's also a journal on MT, but that's not my area, so I don't subscribe.

6693. GDOS Fonts needed

Newsgroup: comp.sys.atari.st
Date: 1992-06-23 19:12:58 UTC
From: AHOFFMAN@CIPVAX.BIOLAN.UNI-KOELN.DE
Message-ID: <1992Jun23.191258.116243@rrz.uni-koeln.de>
Source record: 220485

Hello!

I'm looking for GDOS fonts to use on my system. I tried the font packages on atari.archive., but there are two problems:

1. All these fonts on a.a. are proportional fonts. I need UNproportional fonts because the applications I'm using doesn't support proportional fonts.

2. I haven't seen many printer fonts for a NEC P6 and/or DESKJET printer.

If anybody out there in the net has some sets of fonts (UNproportional ones!) for the SM124, NEC P6 and DESKJET resolutions, or knows where to ftp such stuff, please let me know.

On the other hand, is there any font editor for GDOS fonts that works like the font editor that comes with SIGNUM!2, in that way that you create a font in one resolution and the editor converts it for you to any/some other resolution?

Hope there's someone who can help me...

CU

>
>SO:
>
>Do either of these things actually exist?
Yes. The ST Book has been on sale in the UK for a couple of months now.
The price is about 1300 UKP which is stupidly high for the spec so
apart from Atari die-hards it is pretty doomed. It really ought to
be around #700 if it's going to sell.

Reading from the Silica Shop ad in this months ST User..
1Mb RAM
20Mb HD
10 hours battery life.
8mhz 68000
640x400 supertwist mono display
RS232, parallel, midi, dma & 120 pin expansion
Built in organiser, file transfer software & cable
3 1/2 drive available soon.

Oh yes, and 16 nights free hotel accomadation if you buy one :-)

As for MTOS, it's real but currently beta only.

>
> -- David Paschall-Zimbel

The definitions you listed above are interesting, but hardly based in reality. The programs released by Shareware authors are crippled for a good reason; most of them have released fully-operational versions of other programs and received absolutely nothing in the way or compensation for their work. Can you blame them for wanting to make sure that it doesn't happen again? One user mentioned that a program he uploaded was downloaded more than 1500 times (the message was posted here in comp.sys.atari.st) but the author only received about twenty registrations.

It would be nice if a programmer could release a program and receive compensation from the people who use it regularly, but this doesn't seem to happen. So why am I defending the practice of crippling Shareware programs?

The answer is simple; within the next month, I am going to be releasing a terminal program called ShadowTerm II to the general public. I wrote the program for my own use, with a secondary objective of learning more about Pascal programming. My third objective was to release the program so that other people could use it. If I had put, say, a month or two of work into it, I would have released it as Freeware. Instead, I put over a year of work into it and I will release it as Shareware. I have every intention of disabling the save feature, and possibly a few other relatively minor features. I really hate to do it (and I mean that) but since it is the only way to ensure that the people who use it pay for it, it is what I will do. I have seen too many other Shareware authors get burned by people with bad attitudes to do anything else.

Face it, who will get hurt by this? The users? No. If they want to use the program, they should be honest enough to pay the fee. Will I be hurt? Perhaps less people will use the program, but I don't think that will affect me much, since those will most likely be the people who would not have payed anyway.

I've already said it, but I don't like the idea of crippling Shareware programs. Unfortunately, it is the only way to make people purchase the product if they intend to use it.

The actual definition of Shareware should be this:

Shareware (noun) - a concept in which the user is presented with a program for the purpose of evaluation. Should the user decide to purchase the program, a fee is sent to the author.

Note that I did not specify that the program must be fully-operational. Does the disabling of a save feature prevent the user from evaluating the program? No. It prevents him from using the program without paying for it.

I'd like to here comments, but I'm not interested in flames.

6702. GNU indent

Newsgroup: comp.sys.atari.st
Date: 1992-06-24 04:17:06 UTC
From: agostino@concour.cs.concordia.ca
Message-ID: <4396@daily-planet.concordia.ca>
Source record: 220597

Hi all,
I just d/l'ed GNU's indent version 2.1 from atari.archive and upon
trying to indent a small C file (206 bytes), got a "virtual memory exhausted"
error. I have a 1040ST with 1meg RAM, no HD. I use Gulam as my shell, and
with a few accessories, end up with about 530k of ram left. Now, the indent
program is around 74k. Is it conceivable that it would need more than 500k to
indent a 206-byte C source file?? Has anyone else experienced this problem? Is
there a way around it? Are there any other good C beautifiers/pretty printers
for the ST which do not require huge amounts of memory to use?

Any info greatly appreciated!

>
>
>I saw the Lynx advertisements on TV. I guess what really will help
>right now is if we all go down to our favorite Lynx dealer and tell them
>we want more game cards to choose from.

Yes!! LOTS of Lynx ads on TV and papers so Atari is running over
other ads! Pretty soon we will see Atari Falcon ads?! Bookstores sell
Explorer magazine with Batman cover and Len Stys letter inside!

Also news about Lynx Batman game programers..Eric Ginner, Jerome Strach
(Ms PacMan, Checkered Flag, Shanghai, Rampart), Artists Susan Mcbride,
Melody Rondeau, Cartoonists Eric Elliott, Robb Mariani, Philip Temple,
Eric Blumrich, Musician Bob Vieira. Batman game started Sept. 1991
but movie not started until January so programers used empty time to
make best Rampart game!! People working 12 HOURS every day and weekends
so Atari kept Sunnyvale airconditioning on FULLTIME!

New Atari ads is proof Jack 'The Terminator' Tramiel is BACK IN
HIS SEAT AGAIN!!

With WINX, more than 8 windows can be used by applications.
However, the desktop is always limited (hardcoded) to 8 windows
(and provides only 4 windows for the user).
By the way, with MultiGEM II, a new version of WINX is delivered, which
not only supports TOS 1.04, but all versions of TOS.

Why is it so difficult to keep up with the latest compression programs?
I use zoo 2.1, lharc 2.01e and tar/compress, and I never need anything
else! The only program that's being updated quite often is lharc2.01,
but for decompression 2.01e is fine (even if the latest version is 2.01l).
lharc2.01e has been out for quite a while now, and everybody should have
it.

>I recently became the publisher of our User's group Newsletter, and find
>that the people who lh, arc and zoo their articles don't EVER say what
>version was used to create it.

So what's the problem? At least on the ST, all you need is lharc2.01?,
Arc 6.02 and zoo 2.1, at least at this time. Arc 6.02 has been around
for over 2 years for sure, zoo 2.1 and lharc2.01e a year or so, but
they are only really necessary because of the new algorithm. I don't
see why you would need to download new versions of those (which?), at
least for the time being.

This is how it should be. Every clean program will run independent of the screen resolution. If you don't use any dirty tricks and rely on the VDI for your screen output your program will always run on every resolution with every graphics car.

I use Kobold with 18 Mbyte. Kobold only uses up to 10 Mbyte of ram, so there
is no difference with 18 or 30 or 64 Mbyte, is it? :-)
BTW, as far as I know TOS doesn't recognize TT ram correctly if you have more
than 16 Mbyte of it. Did you ever test if your programs really get all the
memory you have?

No, there is another problem. Speed. My ST runs just about fast enough for my liking in single-tasking mode. When I get 3 or 4 programs going under MiNT it's too slow. Can you imagine 20 programs at once?

6717. Answer: Exchanging Files Mac<->ST [long]

Newsgroup: comp.sys.atari.st
Date: 1992-06-24 12:45:14 UTC
From: Jeroen.Scheerder@phil.ruu.nl
Message-ID: <Jeroen.Scheerder-240692142255@mcscheerder.phil.ruu.nl>
Source record: 220516

On the subject of getting stuff across between Spectre/ST and Mac I think I could clear things up a little. I think you'll find a quite complete summary of how-to-get-things-done.
First, a more detailed answer to the question raised on the net that lead me to write this:

> > I actually FTPed a program from the Stuttgart Ftp site which will
> > transfer MAC disks without the need for hardware. It only goes one way,
> > but the reverse operation is apparently available. Does anyone know
> > more about this?
>
> Could you be so kind to be more specific?
>
> 1. What's the name of the program? Path on ftp.uni-stuttgart.de?

The program is called MacExchange. You've probably got the demo version, which only 'translates' one way around.
What the program does is support two weird disk formats - a strange Spectre format and a strange Mac format, both 720kB MFM. A Mac with a HD drive (almost any Mac nowadays, except the Plus and a few SE's) will be able to use the 720kB Mac disk, the program can convert the entire disk to a 720kB Spectre disk.
The full version can be obtained from the author, as is stated from the docs. I have bought it, and it works fine. Price: About $25.

After I bought it, I've been involved in further development too. I've created a prettier user interface for it, and there were some improvements (more options, floppy disk detection, sensible defaults etc.) I am not sure, however, since the author and me have not been in contact for a while, whether he actually released MacExchanger II. I'll try to find out.

> 2. On what system does it run?

Any Macintosh system that supports the Hierarchical Filing System - that is, 4.0 onwards. Any system that works with Spectre will do, I think. There are no INITs or CDEVs or anything to install on your Mac [Spec].

> 3. What disk recording formats/densities are supported?

See above.

> The only thing I know that there exists a DOS program that is able to
> read/write/format Mac HFS 1.44-MB disk, because they are also formatted
> in MFM mode, like normal DOS disks, only with a different file system
> (HFS). But it is impossible to r/w/f a 720-KB disk in GCR format with
> a DOS/TOS disk drive without additional hardware.

There _are_ other ways of getting things across, without 'converting' anything. As of Spectre 3.0, you get a Mac Plus that thinks it has a SuperDrive (HD) built in. Therefore, some Mac utilities that allow you to use DOS disks run just peachy on it. I know of three:

* PC Exchange, by Apple itself: needs 3 MB and System 7 (so is right out for Spectre users currently) Price: Unknown
* DOS Mounter: will mount DOS formatted disks and maintain a Mac filing system on it. Slow. Price: About $100
* AccessPC, the best IMHO. You get an in-line formatter (if you insert an unformatted disks you get to choose whether you want to format it as a Mac [which means Spectre when in Spectre] or a DOS disk). DOS disks are mounted on the Mac as well as on the Spec and can be used to transfer stuff.
Minor Caveat: Under System 7, AccessPC <= 1.1 could sometimes mess up a little file called APCINFO.DAT, which it used to store Mac file infos. This resulted in the Mac crashing and the disk being unusable. This bug is supposed to have disappeared in recent versions (2.0?). Price: About $100.

Of course, the best solution still is using the GCR - if you've got one, and if it works with your ST's disk drive. But that's cheating by using extra hardware :-).

Hope y'all find this info useful, J.

:
: If you are talking about the overscan mod, the early version worked
: with Tos 1.2
:

In fact, it is mainly TOS independent cause it is too close to
hardware to use TOS: upper & lower lines can be overscanned by switching
from 50Hz to 60Hz at some favorable time (the shifter is a bit upset
by this switching and "forget" to stop printing lines), while for the
left and right border, the trick is to switch between Hires and Lores.

I don't know much more details (can be found in the french magazine
ST Magasine about 2-3 years ago) but, as you can see, TOS has nothing
to do with it (it does hard use of interrupts, assembler and needs speed).

Anyway, a hardware overscan is much easier to do (as does Autoswitch-overscan)
Just look at "overscan" at a.a !

: >
: What are the specs for the 68060? (And why will there be no 68050?)
: Lawrence Gold

I have no precise idee but:

As you know, there has always been a competition between 680xx and
80xxx the first x of each coresponding. Until now, 680xx have been
more powerful than 80xxx. This is still true for the 68040 compared
to 80486 (of course at same clock speed).
I heard some months ago that Motorola was planing a 68050 which was
just an improved version of 68040 (as 020 to 030). BUT, since then,
some more precisions have been known concerning 80586: it is radically
new: with superscalar or superpipelining, RISC core cpu and about
100 MIPS.

That's why I personally think that Motorola gave up with his 68050 that
wouln't have been in the race any more!

Any way, I don't know whether there'll be a 68060 or whether Motorola
has decided to give up this line to concentrate on PowerPC or on
the very powerful (although not successful) 88000 ! Wait & see !

Since nobody has mentioned COMPILERS yet, I'll mention one:

Cambridge LISP (by the Lattice C people, I believe) was a commercial LISP for the ST that DID feature a compiler. I'm not sure how far it went towards producing native code.

I doubt that it's terribly supported anymore, and it's not QUITE Common Lisp. An orphan copy has been kicking around the main local Atari store for a couple of years, and if it ever gets marked down low enough, I'll pick it up and play with it. I'm NOT going to pay $120 for it, when I can get Common Lisp for free...

: Hi there!
:
: A few years ago I bought my 520 ST. Well, now I need a RAM upgrade.
: The problem is that I don't know of anybody here in Houston that will
: do it. The places that I have called tell me that the upgrades in my
: particular ST model are hard to make. So, since I just graduated as an
: electrical engineer (big deal) I think I can do it myself. All I need from
: you guys is some good advice from people who have tried it before. If there
: is anybody out there who might give me some hints I would greatly appreciate
: it.
:

I upgraded mine with 2 SIMMs and a few accessories (sockets, flat cable,
standard board,...): just get the pin order of SIMMS, of Atari ST
(from MMU,DRAMS,drivers or ...) and connect the corresponding points
(just add a little "serial" resistor between MMU and SIMM for the
CAS signals. And don't forget to use good power-supply-cable
(better: use two cables for 5V and two cables for 0V) !

I already did it in 4 Atari ST (520 ST, STF, Mega) without big
problems (apart from flickering when using too weak supply-cables)

Good Luck !

Message-ID: <1992Jun24.153937.27253@usho93.hou281.chevron.com>
Source record: 220519

In 1987, I bought a 1040ST, a copy of Word Perfect (the first release, I believe), and an Okidata Okimate 20 printer. The printer worked fine for all applications until I tried to print from within Word Perfect. When I sent the print command, the printer typed out a single letter (capital P, I think) and never worked again under any application. This happened three times, with assorted exchanges and warranty repairs. The next release of Word Perfect fixed the problem.

Everyone I asked (Atari, Okidata, Word Perfect, local experts) was unable to tell me what happened; WP went so far as to duplicate my hardware set-up without duplicating the problem.

Although the question has been moot for years, I have always been curious as to what actually was going on. Has anyone ever seen another case of a particular piece of software breaking hardware? Any theories? If it matters, my machine has TOS 1.0.

Thanks.

There are several things that really bug me about Word Perfect for the Atari ST. For one, the program is VERY slow... Even the most basic public domain word processor can outrun the scrolling of WP for the ST. Who are these programmers? (And why are they still in business? :)

My main complaint about the version I have is the lousy fileselector that they used. I thought I heard something about a patch that would allow use of UIS III, or even the GEM file selector (which I like better than their poor attempt) Where can I get this patch?

>other programs and received absolutely nothing in the way or compensation
>for their work. Can you blame them for wanting to make sure that it
>doesn't happen again?

I don't have a problem with so-called "crippleware." Hey, I have the program in my possesion and I can read the manual and use it and see if it will do what I want. If I think I want to use it then I mail off a check and in two weeks time I have a full-fledged version. The only people who would object to such a deal are those who simply want the dang thing for free.

[I'm talking about non-obnoxious crippled programs here. Authors who force the user to sit through a thirty second intro screen, etc., obviously don't know much about marketing and customer service and shouldn't be in business.]

The people who violently argue for pure shareware over cripple/demo-ware do so on the grounds that they should be TRUSTED to pay. Yet dismal registration percentages show how far this trust usually goes.

Hi everyone!
This might sound like a stupid question but I am asking it anyway.
What version of TOS is Rainbow TOS (I had a piece of paper about it but
it got lost:-).
Also, what difference does the version of TOS you have make?
Is there some kind of major speeding up or what?
(I told you this was a stupid question)

help!

>been considering getting a multisync for some time now, and if thatll
>stop the flicker, that basiclly settles the question.
>

When I run it in "flicker" mode on my NEC 3D, it flickers pretty badly. It's not that bothersome to me; the thing I don't like is that the screen is so distorted. I'm sure, though, that if you found a monitor that could handle 800 line non-interlaced, it wouldn't flicker. However, and it's a big however, finding a monitor that can handle that and the st low and med resolutions will be extremely difficult if not impossible.

>One other thing... Its interesting to note, that GEM programs, run
>under the higher resolution can handle it. Even the desktop can.

Hi, I'm interested in talking the lab I work in into purchasing GEMULATOR for the 486 we just got in.

1) Where do I order it?

2) How much does it cost for the minimal settup? (say just the card and TOS 2.06 or whatever...)

3) When can I expect to actually recieve it?

Hello all. I just received a SuperCharger from my sister (who couldn't use it for various reasons) so it is not the current release I presume. Can someone tell me what the current version of software is for this? Mine has version 1.4 and came with Dos 4.0. Are there upgrades for this box available or in the works (VGA graphics in particular would be nice)?

Does someone in the US support this box?

Well, it looks like the problem I had with GNU's indent version 1.2 ("virtual memory exhausted") had something to do with the fact that I'd packed the executable. It seems to work ok unpacked. But: it only accepts Unix-style text files (i.e. it treats ^M's like ordinary characters...) :-(

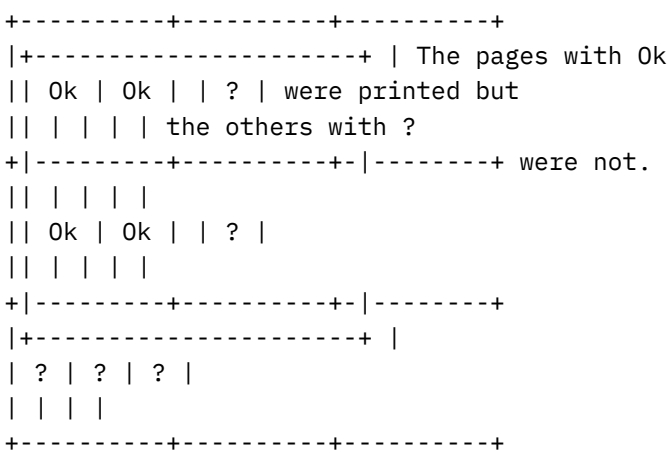
6735. BeckerCAD ST output problem

Newsgroup: comp.sys.atari.st
Date: 1992-06-24 20:12:04 UTC
From: hartlenk@newton.ccs.tuns.ca
Message-ID: <1992Jun24.201204.13638@newton.ccs.tuns.ca>
Source record: 220530

I'm having a problem with BeckerCAD ST when I print a .CAD file using BC_OUT.PRG for dot-matrix printers. It seems to be ignoring the right most and bottom most portions of the drawing when I choose the "divided" option. It appears fine in the preview window, but it isn't all printed. I tried printing in landscape and portrait mode with a simple drawing having a border a 1/2" in from the perimeter of the drawing area. It printed the following parts of a 22" x 17" drawing (shown as the inner rectangle).



Has anyone else using BeckerCAD ST experienced this? Is there a solution? It also did it when I tried to print a 17" x 11" drawing with similar results. The program versions I have are: BCAD.PRG v1.2 and BC_OUT.PRG v1.4. I read a review of BeckerCAD ST which said it was version 1.29, but the version of BC_OUT.PRG wasn't mentioned.

6736. Re: SHAREWARE, discussion wanted

Newsgroup: comp.sys.atari.st
Date: 1992-06-24 20:25:57 UTC
From: petcher@ds10.scri.fsu.edu
Message-ID: <9505@sun13.scri.fsu.edu>
Source record: 220532

I hadn't thought about hte issue of sharware much, but in reading Michael Forget's comments I started thinking a little, realized I do not use any shareware programs at all (with one exception - see below), and began to wonder why. For me it is clearly not a matter of policy, but a practical/psychological matter.

I think there are two reasons. First, I like very much the attitudes expressed implicitly by those writing public domain software and freeware and feel a part aof a community that is supporting one another when I use and help support those programs. Each person gives a little and takes a little, and in the end we have a very nice collection of software for our machines, covering most areas. So if I can offer something in compensation for the use of some free software, I tend to feel happy to do so. Although I haven't written a commonly used PD program myself, I've been involved in making suggestions, beta testing, porting and am presently working on translating a manual, all of which adds to the spirit of the common cause and makes me feel a part of it. It's the least I could do for the likes of Uniterm, gcc, CS-TeX, etc. which I use on a regular basis. In the case of sharware, I feel no such comradery, and would be just as happy to purchase a commercial program if it fills the bill for what I need if nothing can be found in the public domain.

The other reason has to do with the typical sharware that is on the market (note - there clearly are exceptions so please don't flame me for criticizing your favorite program). I think typically shareware consists of programs which people have written that are not quite seen as filling a unique enough nitch or are not quite competitive enough so as to warrant commercial marketing (or perhaps the author does not want to spend the time), but a good deal of time has been put into the program so that the author feels the desire to be compensated. This casts the shareware author in a role outside of the PD comradery circle above, and makes many of us prefer psychologically (perhaps only on a subtle level and not a conviction) to look for a PD program to suit our purposes rather than go for shareware. Since much shareware either is fairly simple (i.e. does not do a lot), or falls in a category likely to be covered by free software, there is little need to turn to the commercial market.

Please don't misuderstand. I am not criticizing the concept of shareware per se, but only trying to analyze why psychologically I don't gravitate towards it. The notable exception in my case is a bible search program by Spiritware, which is unique, and cannot be replaced by any software I know of, PD or commercial.

I don't care if an author releases a crippled version of a program. I object to the use of the term 'Shareware' for such releases. That was the whole purpose behind the definitions -- to use words properly.

>It would be nice if a programmer could release a program and receive
>compensation from the people who use it regularly, but this doesn't seem
>to happen. So why am I defending the practice of crippling Shareware
>programs?

I don't object to the release of a crippled version of a program. I object to the use of the term 'Shareware' for such releases.

>Face it, who will get hurt by this? The users? No. If they want to use
>the program, they should be honest enough to pay the fee. Will I be
>hurt? Perhaps less people will use the program, but I don't think that
>will affect me much, since those will most likely be the people who would
>not have payed anyway.
>
>I've already said it, but I don't like the idea of crippling Shareware
>programs. Unfortunately, it is the only way to make people purchase the
>product if they intend to use it.

You are not producing 'Shareware' ... you are producing a product for which you expect payment BEFORE a fully working copy is provided. You may obtain more money that way, but it ISN'T 'shareware' -- it's a crippled demonstration of your sub-commercial (sub-commercial because you don't think it's worth the cost of advertising the product) program.

Just be sure to put the word "demo" in your documentation.

|> case of a particular piece of software breaking hardware?

Yes, in fact we are seeing that right now at NCSA. One of our research
programmers has a code that runs on the brand new Connection Machine-5.
This is a massively parallel machine based on 512 SPARC processors.

Each time this researchers code has run, it blows out a few of the
processor boards. Other programs do not do this. I think they've
tracked down the hardware problem that manifests itself when this particular
program is run, now.

All in all, it is very wierd.

>The people who violently argue for pure shareware over
>cripple/demo-ware do so on the grounds that they should be TRUSTED
>to pay. Yet dismal registration percentages show how far this
>trust usually goes.

I wouldn't say that "trust" had much to do with it. Rather, the whole concept of Shareware, as it emerged in the Intel-clone domain during the early years, was that people were probably willing to pay a minimal fee for a good program. The program could be widely distributed at zero cost to the author, and whatever profits were derived from that distribution were free and clear -- there were no overhead expenses involved. It was a MUCH easier way to get a product to the people who would use it, and the honesty of the author in providing a tool which matched the description of said tool was greatly appreciated.

It didn't hurt that there were well over 5 million Intel-clones out there at the time.

Today it appears that some people believe that any program which they've spent more than a week programming should gain them hundreds, if not thousands, of dollars in return for the selfless act of releasing the program to an on-line service.

So, they release their program, not understanding that 90% of the owners of the computer upon which their program runs do not own a modem; nor that 50% of the owners of the computer upon which their program runs do not use anything except commercial programs. When they fail to recover the expected dollars, they get bitter, blame it on the untrustworthiness of the computer user, and plot ways to cripple and otherwise make their 'shareware' offerings useless to the public.

What did the Intel-clone Shareware authors do that the Atari ST Shareware authors didn't? They analyzed the market. Word processors, as an example, cost a large amount of money, upwards of $500 for a simple package. PC-Write offered the same sort of features at 1/20 of the cost. Of COURSE people sent in the shareware fee!

Now consider, FLASH II (a commercial telecommunications program) is now available at a street price of $40. Freeze-Dried Terminal is a 'demoware' telecommunications program available at a cost of $15. UNITERM is a 'freeware' telecommunications program available at a cost of $0. Am I going to consider Freeze-Dried Terminal when, for $25 more, I can obtain a commercial program, well-reviewed in any number of Atari ST-related magazines? Only if the 'demo' provides me with a sense that the program is better than UNITERM and that it is

exceptionally better than FLASH II. The cost/benefit ratio is not as good for Freeze-Dried Terminal as it was for PC-Write. Ergo, fewer people will consider it -- and fewer sales will result. Should the author of Freeze-Dried Terminal fret because sales are down? Should he design even more clever ways to extract money from the shareware public? Should he complain that there are no trustworthy people out there because he isn't making as much as expected?

[Hint - the answer to the questions is "no". "Know your market -- and your competition" is the first thing any author should learn before attempting to launch a shareware product.]

Now consider, you've come up with a unique program for which there is no competition. You spent quite a long period of time producing the product. You believe that you should receive money from those people who would find your program useful. What should you do?

Release the program commercially.

I know, I know, you don't have the funding to do a commercial release. Besides, you've heard that this 'shareware' thing is a great way to distribute your program -- you place it on an on-line service and, pretty soon, the bucks are rolling your way.

Problem #1: the number of people who download your file is NOT equivalent to the number of people who can actually use your program. You lose a sale.

Problem #2: the number of people who see your program as 'less than commercial quality' rises -- you did release it as 'shareware' after all... You lose a sale.

Problem #3: the number of people who are put off by the clever inducements you have placed in the program to demand payment increases. You lose a sale.

Problem #4: the number of people who actually pass on your program to another computer user can be counted on one's hands and toes. They are primarily user club librarians. Your program is packaged with a dozen other programs, all vying for the attention of the club member who gets the DOM upon which your program is located. Some of these members never even bother to look at the programs on the disks they get. You lose sales.

Problem #5: your program doesn't work properly on the user's system. You are never going to hear about this problem, because the user isn't sure whether it's a hardware problem, a software problem, or a problem with the method you've used to cripple your 'shareware' offering. The program isn't worth the time to pursue the matter. You lose a sale.

You get discouraged. You spent a lot of time on this program, and people should have shown their appreciation with money. You accuse the user community with thievery (using your program and not paying for it). You get bitter, and the comments from people like me appear to enhance your own views of the nature of computer users.

Now, if you had released the program commercially, either as an offering from an established house (such as the CodeHead, Gribnif, DoubleClick, etc.), or as

an individual offering, you would know the most important thing: the number of people who purchase your program. If this number is low, you can probably deduce that there really isn't a market for yet another slicing-dicing file selector. If this number is high, you must have done something right.

In conclusion:

You're not going to get RICH(tm) writing software unless you name is Bill Gates.

If you write a trivial program, expect a trivial return if you release it as shareware.

If you slaved for years over a program, and really think it is worth paying for, offer it commercially.

If your program is a [database, spreadsheet, word processor, editor, terminal program, compiler] it had better be the BEST in its field if you expect to get any money by releasing it as shareware. There are already too many freeware and low-cost commercial programs out there as your competition.

>so Atari kept Sunnyvale airconditioning on FULLTIME!
>
>
>New Atari ads is proof Jack 'The Terminator' Tramiel is BACK IN
>HIS SEAT AGAIN!!

Hey, I had a talk with him about the way he edited my first letter
that was published in Atari Explorer. The sentences were rearranged
so the meaning was changed.

I then sent in another letter to Explorer with my subscription and if
I'm correct, it was smaller than the one that was published.

I think he added the Free-Net access info but that was alright,
I didn't mind. :)

I do think the Lynx ads will definitely help Atari out.
This is the marketing that I've been looking for.

6742. For Sale/Trade, Wanted, ...

Newsgroup: comp.sys.atari.st
Date: 1992-06-24 23:23:22 UTC
From: dtarico@misvax.mis.arizona.edu
Message-ID: <1992Jun24.162322.1@misvax.mis.arizona.edu>
Source record: 220538

WANTED :
-> Atari external disk drive cable (the type with the round plugs)
-> a bare 1.44 meg floppy drive that will work properly with an
ST. (or course the ST will have the necessary controller
modifications) I am just looking for a bare drive.
-> Other ST stuff you might want to use to trade for/towards
the following goodies:

For sale or trade :
-> Atari 1040 STf computer. This is just the computer (no monitor,
software, etc). It has the standard TOS 1.0 (1.4 available),
1 meg RAM, built in 720k drive, manual and mouse. $175?
-> STime battery backed up clock. Plugs in internally in a 520 or
1040 ST. Usually works, but seems to loose the time when you
play certain games or don't use the computer for a long time.
This is installed (and included) in the above computer, but I'll
sell/trade it separately if you want.
-> Astra Systems hard drive host adaptor. May or may not work (It
doesn't like my 200 meg drive at least). I don't know
much about it, so it is "as is".

-> DynaCADD software. This is version 1.4, but it is fully
registered and is upgradable to version 2.0 for $99. Includes
all disks and manuals (hardly used) and info/order form for the
upgrade to ver. 2.0. As far as I know, version 2.0 sells for
about $640 mail order. If you are interested in this, make an
offer. Note, however, that I will probably just keep it if the
offers are too low. This is SERIOUS, professional CAD software.

That's about it for now. If you are at all interested in any of this
stuff, or if you have one of the things I am looking for, or if you just
have questions, please contact and we'll talk. Let's make a deal! I can
be contacted either by email, or you can try to reach me at home at the
number listed below. Thanks!

6743. FREEWARE printing utilities

Newsgroup: comp.sys.atari.st
Date: 1992-06-25 00:07:08 UTC
From: hartlenk@newton.ccs.tuns.ca
Message-ID: <1992Jun25.000708.21036@newton.ccs.tuns.ca>
Source record: 220540

I've uploaded two files to the atari/new directory at
atari.archive.umich.edu.

The programs were written by me and here is a brief description
of each:

CDPRNT15.ARC (Code Print v1.5) simply prints ASCII files in
double column format with a date, time, filename header on
each page. Prints 116 lines/per page to save valuable
printer paper. I use it to print source listings when I'm
debugging.

JACKET17.ARC (Disk Jacket v1.7) creates a disk jacket like
those for 5.25" disks with a directory listing of your disk
with the date, available space and volume name along with a
file list sorted by directory. The printed jacket (can print
a jacket for a 3.5" or 5.25" disk) is then folded up and
your disk is placed in it.

The programs where written for the ST, however a PC
executable file for each is also included in the .ARC file.

Well, at the 'local' dealer the other day, I saw a TT with 32 meg, and he very nearly used all of it. He scanned a picture at 600dpi, 24 bit color, and the resulting file was 19 meg all by itself. Having the whole thing loaded into RAM and playing with it with Retouche Pro and Didot Pro was absolutely stunning. And no redraws, it just scrolled. Amazing.

That still leaves another 32 meg to fill up, but it really isn't that hard to imagine a use for it.

Message-ID: <1992Jun25.032412.11530@u.washington.edu>
Source record: 220543

Hi Netters!

I will be (maybe) buying a Supra 52Meg Hard Drive in a few days. It is brand new and only $399.

Before I make this purchase, I was hoping anyone out there with experience or knowledge of Supra products could provide any information (positive or negative) regarding the drives reliability, speed etc.

I do not know much about Atari HD setups, but I do know that:

A supra is not SCSI (but no, I will want to hook up other drives)
It is loud.
It is LARGE (looked almost as big as my monitor!)

Any suggestions on HD utilities?

It seems like for $399 a good deal. It is supposed to be ready to roll, just plug in and go!

Any buying tips would be greatly appreciated.

Thanks in adavnce,

Roger Mcghee (automan@milton.u.washington.edu)

Well, if you use vanterm 3.8 as a communications software,
and do unix, your in the same boat as me.

My question is, how the heck do you print something on the screen,
when your doing unix?

And how do I get vt-100, with vanterm and uniterm, is uniterm
supposed to work like vanterm?

Thanks.

Hi,

Having read so many articles about the HD floppy drive attached to
an MEGA STE, I wonder about updrading to 2.06.

Besides of the possible 1.44 drive problems solved(?),
I wonder what is new in that version.

And please do not forget the things that do not longer work:-)

Thanks,

John

If you use LHARC V2.1xx then there should be no problemo.
This version upacks .LZH from V1.3xx and V2.1xx.
Just use the x command.

If that doesn't work, get a different archive, for example a .ZOO,
or ask someone via (e)mail.

I'm new to the ftp world and I need some advice.

I'm OK on downloading documents/text files from the various archives using "anonymous," but how do I download programs and utilities--in a form my ST will understand? (This is all being done on a Mac SE, mind you!)

Right now I've got a couple of files (an .lzh and and an .arc) residing on my Mac hard disk; how do I plug 'em in the ST?

Large thanks.

Gary

> And how do I get vt-100, with vanterm and uniterm, is uniterm
>supposed to work like vanterm?

If, by your question, you mean "Does UNITERM emulate a VT-100 terminal", the answer is YES.

I have been using UNITERM since version 1.4, and have never had a problem with 80-column terminal mode. I work with VAX and UNIX machines daily, and have a frequent need to connect with them from home at odd hours --- UNITERM has never let me down.

If you have a printer connected to your ST, UNITERM allows you to "print the current screen" and "print whatever comes up on the screen". The former allows a screen dump, the latter allows continuous printing as though you had a printer attached to a real VT100.

The file transfer protocols available work well. I especially like the ability to run a program while connected to a VAX at work -- for instance, running a shell program or editor to get a file in shape for transfer. UNITERM doesn't have a built-in ZMODEM protocol, but the ability to run an external program makes it simple to use 'sz' or 'rz' while online.

I haven't used the macro capabilities to their fullest, but there is ample documentation if you want to take the time to create a log-on macro, for example.

Overall, UNITERM is a very nice program. I've played around with a number of telecommunications programs (including VanTerm), and I keep coming back to UNITERM.

GNU C (which now incorporates GNU C++) requires a minimum of 2.5 megabytes. 4 megabytes of memory is recommended. I dimly remember an EARLY release of GNU C which worked with 1 megabyte, barely. You could only write trivial programs (like "hello world"). I doubt that there are any archive sites containing that particular version.

A hard disk, with about 10 megabytes of space available, is also highly recommended. The binary release of GNU C 2.1 occupies 6 double-sided disks in archived format.

You might want to use the MiNT versions of the GNU C libraries if you plan on writing MiNT-compatible programs.

I think that wasn't the problem. Turbo-C's iostream.h is GNU-C's stream.h.

I got six answers now, and most of them said I should get a new crt0.o
to solve the problem. Bob Malay sent me this file, but I haven't
tried it yet. Thanks to everybody! If it doesn't work, I'll be back!

>
>I think its aimed at musicians who's budgets appear to be unlimited judging
>by the price of MIDI software.
>
>- Leo Hendry

Interesting logic at work here:

MIDI programs are expensive ==> musicians are rich.

Actually I know very few musicians who have large budgets. Professional musicians invest in music software much as professional writers invest in desktop publishing software. It's not a matter of having great amounts of cash, but in investing intelligently in your business.

MIDI software ain't cheap, but then, it takes an extraordinary amount of time to develop powerful MIDI software with a useful interface. Then consider that a MIDI program has a rather limited market and the price of the software can easily be justified.

Considering you can make recordings in a $5000 MIDI home studio that can compare favorably to recordings made in professional studios the prices are quite reasonable.

Can anybody out there help me?
I would like to download some programs that have been uuencoded.
The problem is this.
I am speaking now on a PC(yes it is true :-). I have to log on to
another machine to be able to read the news etc.
So, to get my programs on to my ST I have to do this:-
FTP programs from original site to the machine I am logged on to.
Then Kermit them down to my PC.
Then (this is the problem) once they are on a PC disk can I use this
straight on my ST?

Thanks for any help

In Milwaukee, Bob Brodie told me that the ST Book is being revised a bit on the basis of the response to the early units. This is going to mean further delays, necessarily. He looked sad, and was in no way encouraging, when I asked about maybe July sometime.

It'll arrive in the US when it arrives. I'm sure there'll be some fanfare.

Steve

> No, there is another problem. Speed. My ST runs just about fast enough for
> my liking in single-tasking mode. When I get 3 or 4 programs going under MiNT
> it's too slow. Can you imagine 20 programs at once?

It depends (tm).

If you have four programs going under MiNT, it's likely that most of them
are actually doing something.

If Joe User has a cartload of programs active under MultiTOS, I'd bet that
most of them are going to blocked, waiting for a GEM event. That shouldn't
translate into performance degradation.

For that reason, I think a lot of people are going to find MultiTOS useful
on a 4-meg machine -- in spite of the shortcomings of running it on a
68K-8mHz, including speed as well as lack of memory protection.

We use Macintosh Multifinder under System 6 and the multitasking System 7
on some of the photo-editing stations at work. Most of the time it's just
a matter of convenience, keeping several major applications available for
a quick switch. There's no performance degradation there at all -- just a
requirement for gobs of RAM.

The exception is when the night photo editor is pulling Reuter images off
Presslink via modem in the background, converting TIFF files into Leaf
format in the foreground, and monitoring the Photostream satellite
delivery in a semi-hidden window. Then you can feel the difference, even
on an accelerated 68030. Don't try this at home. :-)

6770. THINK C 5.0 on Spectre works

Newsgroup: comp.sys.atari.st
Date: 1992-06-25 17:53:01 UTC
From: wmagro@uiuc.edu
Message-ID: <BqExoF.Jtr@news.cso.uiuc.edu>
Source record: 220459

I just bought the THINK C 5.0 package for my Spectre. It works beautifully. Really an amazing package. The good news is that the patch for the 4.0 version of the debugger also works on the version 5.0 debugger, though the offset in the code is different.

Thanks to those who figured out and provided this patch. If anyone needs it, I will send it via e-mail.

I am interested too, so _PLEASE_ post any answers. BTW, if the author
of CLA frequents this group at all, I have a few questions about CLA.

What are the memory requirements of CLA (I assume it is mono only).
Is it STE/TT compatible? Is it Mint compatable. Does it support lots of
printers? Does it support Postscript file output? Does it import device
files from other programs (IE. will it import Viewlogic/ORCAD/SPICE models of
other devices). What devices come with the package. Lastly, is it TOS3.06
compatible.

If not too many other people object, could you post a description of
the program (if you answer my questions, you'd just about be doing that
anyway :).

Thanks!

I've written a program to print DEGAS and NEO pics. I am
releasing it as shareware and asking 5 UK pounds to register -
this includes a manual and various ancillary stuff.

I have also circulated an 'unregistered' version, which is fully
functional. It is with all the PD libraries in the UK, plus the
major ones in the Netherlands and France.

I'll be glad to upload and/or post it somewhere you can get hold
of it, if you're interested, but as a newcomer to this Net thing,
I don't yet know how to do so, suggestions welcome.

Oops. I know its bad form to followup your own post, but....

>even 3.01 or 3.0 for that matter, but they sure fixed some bugs and added a
>whole lot of new features!

I realize that TOS 2/3 introduced the first version of TOS to nicely
allow the addition/modification of icons, but will future versions of TOS
allow for greater flexibility of those icons? Specifically, I have heard
that there is a limited number of icons that can be present on a running
system - that is, if you already have 32 (or 256 or whatever the limit is)
icons and wish to add another, that you have to remove one before adding
your icon. Isn't there a way of dynamically sizing the number of icons usable?
I realize that that could induce a performance hit, but if the user realizes
this, but wants the other icons, they should be able to do so.

I have been told that the icons are also limited by the number of
colors that can be used on the desktop to something like four colors. This
is rediculous considering all of the 24-bit color cards available, not to
mention that you can get 16 colors in low rez on a lowly 520ST, why not go for
a larger number of colors usable? The lack of colors on the desktop makes
it look a lot worse than it should be. I think that 256 colors would be a
reasonable number (of course, that is just for the icon's software stucture
since you will still be limited by the screen resolution you are in), but if
you want to limit it to 24 (or even 16) bit, _I_ won't complain! :)

These are the changes that I would like to see in MTOS, up and above
any of the other changes already made.

Anyway, enough of the soapbox, my feet (fingers) are getting tired.
:)

>Is there some kind of major speeding up or what?
>(I told you this was a stupid question)

Phil, the only "stupid" question is the one that's not asked.

Minor variances aside, the major TOS versions released from Atari are:

TOS 1.0 - from the original 520ST/1040ST. Did the job but slow and suffered some annoying folder bugs, et. al.

TOS 1.2 - for the original MegaST machines. Fixed some of the bugs (not all) in TOS 1.0 but basically very similar.

TOS 1.4 - This is the famed "Rainbow TOS" first out for the STe. A vast improvement in performance over TOS 1.0/1.2. Very worthwhile even though a few programs (mostly older games) might not like it. Excellent upgrade.

TOS 1.62 - This is the latest (I believe) STe TOS version. Not sure what improvements were made over 1.4, probably mostly minor bug fixes.

TOS 2.05 - The first release TOS for the MegaSTe machines. A radically different desktop patterned on that of the TT machines. Lots of nifty features and ideas "borrowed" from alternative desktops like Neodesk.

TOS 2.06 - A bug fix to TOS 2.05. Now available as an upgrade to older machines through goodies like Codehead's TEC board.

TOS 3.0x - TT TOS visually identical to 2.05/2.06 (or vice versa) but for the TT machines only.

>PS Can anyone tell me how to get a sig file included in the message?

Just create a standard text file of how you want your sig to appear (net etiquette dictates 5 lines or less), name it .sig and put it in your home directory and it will be appended automatically. Also see the newusers FAQ for lots of other tips.

You can simply copy your files from your MAC to an ST formatted disk with
the file transfer program that you should find on one of your system
disks. Be sure to use the standard converter. Then everything should
be fine.

Can you clue me in on what was in this fax (I have no machine)? I've had all kinds of problems running CGR on my TT (but with 720K disk).

Also, does anyone know if an upgrade is out yet to let me hook my hard drive back up to the SCSI port instead of the DMA port (GCR doesn't recognize SCSI)?

As far as I know, there is no way to do this. The problem is that TOS 2.xx/3.xx
use .RSC files to store their icons, and the size of a .RSC file is limited
(32 or 64k, I can't remember...). You can fit over 200 icons in this space,
though.

>
> I have been told that the icons are also limited by the number of

Actually, you're limited to two colours: foreground and mask.

Yes, more colours for the icons _would_ be nice! I suppoes it's partly a
compatibility issue (a 16 colour icon will look pretty lousy on a monochrome
screen :-)). 256 colours would be a problem, at least on current machines,
because they would look like hell in all of the standard resolutions except
TT low. Perhaps if somone came up with an extension for those fortunate
people among us who can afford one of those new graphics boards (I want one,
I want one, I want one), then it would work better (if you don't mind losing
the additional memory such icons would gobble up!).

Nope. It was written by Darek Mihoka. Antic would not put out a
shower/converter that used the same extension that would be quite dumb.
Anyway, try this trick with SPSlideX. Take a bunch of .SPS files and convert
them back to .SPU then delete the .SPS files and ask SPSlideX to convert
again. If memory serves me correctly, SPSlideX will delete all the .SPU files!

Neat, huh?

John,

I think that TOS 1.98 is the latest version for STE. That's what the ST-type programs tell me I have when I run them. No idea what improvements it might have over TOS 1.62. This machine was purchased in March of '92.

Anyone out there have any ideas what 1.98 has that 1.62 doesn't?
(Besides a larger version number and later release date?)

Regards,

Roger Mcghee (automan@milton.u.washington.edu)

I downloaded it a few days ago from atari.archive. Just go to the 'atari/new'
directory and 'get CLA_V1R1.LZH' (the filename in capitals).
I don't know, but maybe they've already moved it to its 'natural' directory
(whereever that may be). But I'm sure it's there.
O, when doing a 'ls' in the 'new'-dir, you get to see nothing. Just ignore
this - in this dir you *always* get an empty listing, even if there are 1000
new files :).

This is incorrect use the x -xhm and some times for incompatible LHarc files
x -xkhm if you don't do this you could end up loosing some files..

Also you can just enter the file name, all folders will be extracted..

Yes, just format your 3.5" Floppies to 720k on your PC.
Or format them with something like "pcformat" on your Atari so your PC
can read and write them. There are several on a.a

Rainbow TOS version 1.4 is the version that works on the traditional
STFM (non-blitter / non-DMA machines....)

and Rainbow TOS version 1.6 (or 1.62) is the one that works on the STE.
(Which lets you use the extras like the Blitter)

so, versions between 1.4 and 1.7 (although I don't think there is a
1.7) correct me if I'm wrong guys!

the known versions are, 1.4, 1.6, and 1.62 as far as I know!

The TOS-versions are splitted in mayor- and minor-release-number. By
knowing that, you would see, that $62 is the same as dezimal 98. :-)

Ciao

From: doucet@ripolin.laas.fr
Message-ID: <7612@laas.laas.fr>
Source record: 220486

I've just uploaded the latest version of Spider
(a two packs cards solitaire) at atari.archive.

For those who have already played it (was spider.zoo
in the 'games' directory), this new version has brand
new graphics that make the play easier and more eye pleasing.
(All graphics done using Crack Art...).
All the rest, rules and controls, are the same.

It's a freeware program, or more exactly a postcardware one.
For this reason, I've just installed a wider mailbox in
front of my house :-)... Anyway, I'd like to hear from people
using it, for further improvments.
(I currently work on musics & sounds, with a fantastic tool
named Megatizer 2.4, french shareware...).

For people who don't yet know it, Spider can only be run on
color monitors with low resolution.

It should be soon into atari/newitems.
for now, it is in atari/new under name spider2.zoo.
(zoo 2.1 with high compression used).

Merry Xmas.

6798. MIDIFILE playback program

Newsgroup: comp.sys.atari.st
Date: 1992-06-26 10:42:19 UTC
From: johnj@echo.philips.nl
Message-ID: <1992Jun26.104219.22053@echo.philips.nl>
Source record: 220491

```
==================================================
Sorry if you see this posting more than once.
It seems that crossposting still doesnot work here.
==================================================

Hi everybody,

I just want to report the availabilty of the next version
of the PLAYBACK program within a few weeks (plus testing).

As you probably remember, PLAYBACK is a MIDI program with a
lot of features to play standard MIDIFILES on your computer.
It allows you to change the channels, volume, program changes
to set to your personal needs, as well as to filter out events,
mute tracks, change speed, transpose, etc.

It has been sent to several archives a few months ago, as well
as being spread via the net. So you should be able to get it.

The program is fully beta-tested, and the first crash has yet to be reported!

For now, it is only available for atari ST/STE/MEGA STE (all systems!),
I already prepared the port to MSDOS-MSWINDOWS, but release date for the
beta tested version of this version will not be before the end of the summer.

I even might port it to X, as I have knowledge and access to that right now.
If only I knew how to output MIDI, and with correct timing there.
Any help on the latter would be appriciated.

The program is free. However, if you like the program, I would like you to
register, as this will keep me going on with implementing many new features
that are on the list, or will get requested. In return of registration
you will get a full manual (in English, German, or Dutch) plus
appendices including -easy to understand- MIDI and MIDIFILE explinations,
as well as a guaranteed update as soon as the new version is available.

Anyway, I promissed that a new version would be available soon,
so find the added features for the next version below:

1. Solving the reported bugs.
2. Program will use a window, to be able to run in multitasking/processing
environment.
3. Program will get compiled to run on 68000-68040 processors.
4. File saving (incl. format conversion).
5. Number boxes will be improved, to allow faster value changing.
6. Global MIDI channel converting.
7. Program change mapping (in addition to key mapping).
```

8. Automatic load of map files at startup of the program.
9. Program can get started with a MIDIFILE in the commandline, which
will be loaded and played then (dependent on options). This feature
allows the program to be installed in the desktop as well.
10. Some track changes will be allowed during song playing, like volume
and program changes.
11. Plus some other improvements.

You'll heare from me as soon as I have a more detailed release date.

Hi again,

I was the one who initiated this posting.
But the answers I got all were talking about the differences between
early TOS versions (Eg. 1.4) and 2.0X/3.0x.

That is not what I really wanted to know.
I do have a MEGA STE with TOS 2.05.
I would like to know the differences between 2.05 and 2.06.

(Do skip the 1.44 Floppy disk subject, as that is handled in other postings
already, although not clear.)

6801. Apple/Acorn

Newsgroup: comp.sys.atari.st
Date: 1992-06-26 11:14:07 UTC
From: sheppard_r@kosmos.wcc.govt.nz
Message-ID: <1992Jun26.111407.28087@peponi.wcc.govt.nz>
Source record: 220441

I here that Acorn computers of the UK, are now in bed with Apple, and
there new RISC chips are to be in the New Apple note pads, it looks like Atari
will have to get its finger out to get better machines as these.

The A5000 the New Acorn RISC Home computer that multi-tasks and runs Unix.

Acorns machines have been runing Unix for some years now,
and has some 26 mips performance..

Acorn even make Unix Work Stations, the R140/160 from memory,
and take note Atari, all from a company of just 120 people...

Acorn knows how to get its act together, they even have a office here in N.Z.
Atari does not...

There new Archemides A5000 cost less here than a TT, and the A5000 comes with a
mult-sync monitor, the TT does not, A5000 is $4500nz the TT $5200nz with out
monitor...

So does that meen that these new Apple Note pads are going to be that fast..

Roger..... sheppard_r@kosmos.wcc.govt.nz

6802. kids-games from bart

Newsgroup: comp.sys.atari.st

From: ALLENMJ@GDLVM7.VNET.IBM.COM
Message-ID: <9206261244.AA12582@ucbvax.Berkeley.EDU>
Source record: 220489

I downloaded kidsong1 and kidmixup for games/kid-games on bart.
Zoo 2.1 would not unpack them but booz did. Now when I run then I get
a popup containing:
Error #-033, PC>$000000
This is on a stock 1040 STf TOS 1.2.

Has anybody successfully used these programs? If so, what machine do you have
and what did you use to unpack them?

Thanks,
MikeAllen allenmj@gdlvm7.vnet.ibm.com

6803. Thanks for FTP info

Newsgroup: comp.sys.atari.st
Date: 1992-06-26 13:07:29 UTC
From: csullogg@cc4.crl.aecl.ca
Message-ID: <26JUN92.09072931@cc4.crl.aecl.ca>
Source record: 220490

Thanks to all those who mailed me info about FTP sites. MUCH appreciated.
For those who asked, my system is made up of the following:

#1: TT with 4 megs ST RAM, 50 meg HD, HPLJII, TTM195 (1280*960 mono monitor)

#2 Mega4ST, 50 meg FA.ST HD, Reflex 1024 card, SM147 monitor,
ICD tape backup, SLM605 laser

Software:

LDW 2, dbMAN 5.3, WordPlus 3.2, WordPerfect, Pagestream 2.1, Calamus SL
Tiger Cub (for my Roland HP1000 piano and MT32 sound box), EasyDraw 3,
MultiDesk Deluxe, Warp 9, XBOOT, STalker 3, Steno 2, Touchup (for my
Migraph scanner), Personal Pascal, FA.ST BASIC, HiSoft BASIC, Spectre
GCR 3.0 (wish I had 3.1), EXCEL, MacDraft. Sold my SLMInit to a desparate
user and now trying to reach Fearn&Music to get another 2 copies, MacPrint.

I am sure there's more but I cannot recall (my 11 year old daughter has a
1040STE and a mess of games - personally, I don't play games, otherwise I
would have the most popular games machine going -> an IBM-PC compatible!)

BTW, I am an authorized Atari dealer. Unlike Darek Mihoka, I don't use the
nets to advertise so I will not post the name of my company.

6804. GCR MOD

Newsgroup: comp.sys.atari.st
Date: 1992-06-26 13:20:35 UTC
From: csullogg@cc4.crl.aecl.ca
Message-ID: <26JUN92.09203524@cc4.crl.aecl.ca>
Source record: 220493

The FAX about the GCR MOD described a simple piggy backing of a chip. I had a local hardware guy put it in my GCR (I am hardware illiterate). re: not having a FAX machine, surely there must be a local business that offers FAX service that you could spring a few bucks to FAX to GBS; it's obviously important for you to get his info!

Date: 1992-06-26 14:20:51 UTC
From: R04E@vm.urz.uni-heidelberg.de
Message-ID: <92178.13
Source record: 220498

Hi!
The address is:
Wilhelm Mikroelektronik
Sueggelstr. 31
4670 Luenen
Phone 02306-25299 and -25575
Fax 02306-25276

As far as I've seen they sell graphiccards from 256 colours (DM 948.-)
up to 16,8 Mill. colours (DM 1698.-).
But you should also look at

Hard & Soft Herberg
Obere Muensterstr. 33-35
4620 Castrop-Rauxel
Phone 02305-18014
Fax 02305-32463

and

Axept Wittich
P.O. Box 1221
8423 Abensberg
Phone + Fax 09443-453

In my opinion Hard & Soft is the most "professional" one.
Good Luck,
T.S.

6808. unix lharc (was Re: serialfx.lzh)

Newsgroup: comp.sys.atari.st
Date: 1992-06-26 16:37:07 UTC
From: rosenkra@convex.com
Message-ID: <1992Jun26.163707.27307@convex.com>
Source record: 220496

i just 5 min ago grabbed lharc.tar.Z from a.a in ~ftp/atari/archivers/unix
and decided to try it. someone recentely said there was a non-st (eg unix)
version that could deal with lh5 and that the rest of us should stop our
whining about lharc. i could not find any other lharc that looked like
it could be for unix (i mean this _would_ be the obvious place to look).
i also looked in ~ftp/unix (nothing there called *lha*). so i downloaded it.
there were exactly 3 files in that directory (lharc.tar.Z, zip.* and zoo*).
there was no lha2.0l.tar.Z.

well, sorry to disappoint you, but this is v0.03 PL 3 (ancient) and on my
system dumps core with a segmentation violation after it sez that it can't
deal with this format anyway.

can one of the lharc pundits PLEASE POST A PORTABLE VERSION OF LHARC WHICH
DEALS WITH lh5 FORMAT? by portable i do NOT mean between ST/STe/et al. i
mean between ST*/MS-DOS/VAX VMS/Unix/et al. and if u do manage to please
the rest of the world with this, make it either a zoo or arc file (not
an lh5 lzh file). note that we do NOT want the questor .ttp. we want 100%
portable all-C source code. ANSI or K&R is fine. NO assembler. i do not
care if it runs 10x slower. if i cannot extract on a unix system, it is
totally unacceptable.

for all the supposed problems people claim that zoo has, i have NEVER had
a single problem extracting/creating a zoo archive with/without directories
on any system i use which have included unix (convex, sun, ultrix, even cray),
ST, and MS-DOS. i will admit that the port to UNICOS was non-trivial, but only
because of 46-bit integers there. and it was a problem with both arc and zoo,
so odds are a UNICOS port of lharc would have similar problems. since i don't
work for cray anymore, i am not sweating this.

in fact, with fiz, i was able to extract all but one file from a damaged
zoo archive recently. the archive took 30 min to download.

yes, i am shouting. and no, i don't have any predelection to zoo or any
archiver. i (we) just want something that runs consistently everywhere.

i do NOT expect this to start another raging debate. i just what the lharc
clan to give us a tool we can use universally.

thanx

Hey, I thought that you could plug 1.4 into a MegaST and still use
the blitter. What gives? I can't believe that Atari would release a TOS
version that would cripple one of their main bread-winners like that.

>improvement in performance over TOS 1.0/1.2. Very worthwhile even though a
>few programs (mostly older games) might not like it. Excellent upgrade.

I thought TOS 1.04 was the long awaited bug fix of TOS 1.0/1.02. The
first STe version of TOS was 1.06. I understand it was similar to TOS
1.04 but 680x0 clean. TOS 1.62 was a bug fix for TOS 1.06.

>TOS 2.06 - A bug fix to TOS 2.05. Now available as an upgrade to older
>machines through goodies like Codehead's TEC board.

This version of TOS is aware of the different ST/STe machines, therefore
the birth of TOS 2.06 upgrade boards for all ST/STe machines.

From: eggert@sun.lclark.edu
Message-ID: <1992Jun26.193120.13422@lclark.edu>
Source record: 220403

I still have the following items for sale: $400 Takes all, or split up as follows...

Atari 1040 STf - $200
1 meg RAM
with Atari mouse
Atari SC1224 - $95
Screen bows at top and bottom. This is
apparently due to a burned out capacitor.
Should be an easy fix.
VideoKey - $45
Use a TV or VCR with your ST.
Works great!
Monitor Master - $29
Lets you switch monitor without
unplugging and plugging.

Software -
Laser C compiler. . . . $50| or both for
Laser C Debugger package. . . $25| $65
GST C Compiler $15
Personal Pascal $15
Quantum Paint $10
BBS Express! ST $30
Universal Military Simulator . . $15
Falcon Flight Simulator. . . $20
Bloodwych $20
Dungeon Master . . . . $20| or both for
Dungeon Master II: Chaos Strikes Back . $20| $30
Chrono Quest $20
Carrier Command $20
Gone Fishin' $10

I also have many disks with public domain and shareware files, and quite a disks from magazines such as STart. These would go with the computer if sold.

Again, all of this could be had for $400. I will pay shipping on any of this assuming it is pre-paid. I will ship c.o.d. if desired, but I ask that the buyer pays for that.

6813. FLASH! Hybrid Arts software to Barefoot Software Inc. - new owners & products

Newsgroup: comp.sys.atari.st
Date: 1992-06-26 19:56:33 UTC
From: galanter@nyu.edu
Message-ID: <1992Jun26.195633.6797@cmcl2.nyu.edu>
Source record: 220401
Cross-posted to: rec.music.synth,comp.music,comp.sys.atari.st,alt.emusic,rec.music.makers

It will be a while before you read about this in the trade press...

Hybrid Arts, makers of midi software for the Atari line of computers and the ADAP digital audio line of products, has come to an end...the ADAP line has been bought out by a yet to be announced company...

BUT the good news is that the full midi software line will be sold, supported, and developed further by a new company...Barefoot Software Inc. Barefoot Software Inc. is a new company owned by the software developers, and is independent of what was Hybrid Arts.

SmpteTrack Gold, a great sequencer with very tight direct SMPTE lock-up, will continue to be sold and supported, and work is now underway on SmpteTrack Platinum.

GenEdit 2.0, a "universal" editor/librarian, is a new release of GenEdit with extended features for studio definition, automatic control of patchbays, creating editor templates, and a large number of new editors for recent and classic instruments.

Barefoot software will also support other software and related products such as EZ-Score and the Midiplexor.

Midi World Network, a free Midi oriented BBS, will now be sponsored by Barefoot Software. The current number is 818-996-7659. (Note that this number may change in the next few months to offer a PC Pursuit exchange).

Tech support for Barefoot Software products has been extended and is available from 9 a.m. to 5 p.m. CST Monday through Friday...and on the BBS.

Barefoot Software can be reached at:

818-727-7143 (voice) 818-727-0632 (fax)

Barefoot Software Inc.
19865 Covello St.
Canoga Park CA 91306

Phil

p.s. At one time I did some contract work for Hybrid, but now I am just a friend of the Barefoot Software family (and a user of their software!) The guys at Barefoot have a much better attitude than the old owners of Hybrid, and I expect that this will translate into benefits for both former Hybrid customers and new Barefoot customers.

Hi.

I own an Amiga 3000 running KS2.04. I have recently
been given the opportunity to aquire an Atari laserprinter.
Its called an SLM804, and seems to connect with a 37 pin
connecter.

Note- its currently in another state, so I haven't seen
it yet, and the manuals are lost.

It's about 4-5 years old.

Has anyone ever heard of it? I'd like to get specs for it,
particularly any information on how Ataris access printers,
since I want to interface it to my Amiga. Ant info about it
would be helpful.

Thanks in advance,

Jason Surace

All I'm certain about with the Supra 52meg drive is that it uses a Quantum LPS52S mech which is an excellent one.

Yes, the Supra is not SCSI, and neither is your ST. That's why you must buy a Supra or ICD drive, because they both have host adapters which convert the SCSI signal to ASCI, which your ST can understand.

It's loud? Have you heard one before?

I'm not sure what case Supra uses to enclose the drive, but I thought it was just a simple shoebox-style case. These are not large at all -- at least nowhere near as large as your monitor!

Suggestions on HD utils? We need to know what type of ST you have and what kind of TOS you're using. If you don't know what version of TOS you have, just give us as many details as you know.

$399 is a great price for that drive.

>
> -- David Paschall-Zimbel

What makes you think the program is sub-commercial? This may come as a
surprise (I sure hope not) but it costs a great deal of money to
advertise products. Money that I do not have. There are commercial
houses that purchase the rights to products from people, but do you know
how to get in contact with them? I don't. I wouldn't mind making a
little money from this program (which is why it is Shareware) but I do
not want to go through the hassle of finding a distributer or
distributing the product on my own.

As for using correct words, I don't see your point. A Shareware program
is meant to be viewed and examined before a purchase is made. If the

program is restricted properly, the limitations will not interfere with
the users' perusal of the product.

I'm glad you took the time to think about the issue. The discussion started with the question of why authors cripple their programs before releasing them, but your points are interesting (and accurate) as well.

>
> I think there are two reasons. First, I like very much the attitudes

> comradery, and would be just as happy to purchase a commercial program
> if it fills the bill for what I need if nothing can be found in the
> public domain.

I am also happy to see Public Domain/Freeware programs. Some of those programs are exceptional, such as Sozobon C and GCC. There is also some really bad public domain software, but for the most part it is good. The idea behind Shareware though, seems to be that programs of commercial or near-commercial quality can be viewed by the user so that a buying decision can be made after seeing the product. There is also the advantage that the author does not have to pay the cost of distributing his product or have to go through the trouble of locating and selling his product to a distributor. Also, Shareware authors usually aren't looking to make a million dollars. They just want a little compensation for the work they put into the program.

Shareware products also tend to fill a niche that commercial products do not. For example, Freeze Dried Terminal (the competition, oh no! <Grin!>) offers a lot for the price. It does more than Interlink and Flash do put together, and it is Shareware. I personally don't like the

interface at all, though, so I have my own program. It does more than Interlink and Flash as well, with the exception of ANSI emulation. I don't have the kind of money needed to distribute it commercially (and wouldn't even if I did, since I don't want to make a whole lot of money at a hobby which would make it too much like a job (which I have already).) Shareware programs do fill a space that Public Domain and Commercial programs usually leave unfilled (with notable exceptions).

>
> The other reason has to do with the typical sharware that is on the
> market (note - there clearly are exceptions so please don't flame me for

> simple (i.e. does not do a lot), or falls in a category likely to be
> covered by free software, there is little need to turn to the commercial
> market.

I agree. Anyone would rather use a free (Public Domain) program instead of a program that they had to pay for (Shareware/Commercial). I would. The reasons you listed for releasing a program as Shareware make a great deal of sense as well. (Wasn't I going to criticize something? <Grin!>)

Shareware programs usually have features that are unique, and they usually are more well-thought-out than Public Domain, although there are many exceptions.

>

Message-ID: <1992Jun26.234349.13185@cco.caltech.edu>
Source record: 220413

Well, as an Amiga user, I can consider myself an expert on
interlacing and its associated flicker.
Presumably, you are entering an interlaced screen mode. You
get double the vertical lines, but each of the even and odd
fields is updated only at 30 hz. The result: the screen flickers.
This is particularly bad for anything 1 pixel high, or with
contrasting colors. You can alleviate the interlace flicker
either with a better color scheme, or some people find polarized
sunglasses or monitor screen help a great deal. (the monitor
screen really does).
Using a multisync monitor makes no difference. In interlaced mode,
you are still outputting at the normal video rate. (in an amiga, 15khz,
the standard NTSC rate). Only now, you are sending even and odd fields.
Your multisync monitor still gets the 15 khz signal. To get rid of the flicker,
you need extra hardware. Maybe the Atari has it built in, although I
doubt it. On my A3000, the flicker is removed by reprocessing the
15 khz signal and the even and odd frames into a 30 khz VGA style
rate. The multisync monitor then runs at the higher sync rate, you get more vertical lines
in every field, and a 60hz refresh.

In any case, you need the higher sync rate signal to get rid of flicker.
An interlaced screen flickers no matter what its viewd on unless its
deinterlaced or the color scheme hides the flicker. (This is how TV's get away
with it).

Source record: 220406

Thanks to everyone who responded to this question. The information I related
in the original posting was from an "atari" expert I ran into in CB mode.
I have never actually used (or seen) a Supra drive used before, so my
assumptions were based on this "experts" comments. I am gald to hear
that it is not large, loud or obnoxious.

As far as HD utilities goes, it has been suggested that I explain my setup:

- 1040 STe with 4 meg
- TOS 1.98
- Color monitor

Thanks again for all the help!

Roger Mcghee (automan@milton.u.washington.edu)

Date: 1992-06-27 02:40:02 UTC
From: nunis@hpsgm2.sgp.hp.com
Message-ID: <52170002@hpsgm2.sgp.hp.com>
Source record: 220425

hi all...

i wish to say a word of thanks to all who responded to my query on c-labs' notator program and which atari to buy.

i went to the shop to look at it and the guy there showed the software to me...needless to say...i was suitably impressed...in fact...i was so impressed i was tempted to buy it instantly...now, if only i HAD the cash...sheesh...

anyway, i still have some questions i need answered before i go and spend my hard money...the system he suggested was a 520ste with a 2mb upgrade of memory and a sm124 monitor. this system would cost me S$2,790 (that's Singapore dollars, which comes up to about $1,800 US dollars at an exchange rate of US$1:S$1.62). so how does the cost add up? does this sound like a reasonable offer? can i get the same thing for less in the US? how about a used one?

another thing, can we really run notator without a harddisk? i mean, how can we right? where can i store my sequences without a harddisk? and how big a disk should i get and how much would that cost? the guy at the store said i do not need a disk...but what do YOU think?

also, i want to be able to print music scores on my laserjet 3p printer and the guy says this is an easy thing to do. has anyone tried doing this and did you need any extra hardware/software to make the connection?

also, can i use an EGA monitor instead of the sm124 (i already have an EGA monitor :)) well, i think i would really like to have notator because i really like the fact of having a sequencer and a notation program in one package...so, do tell me more of your experiences with this great program...and really...i would like to hear pros and cons, this is a hard decision...but one that i must make soon...thanks!

simon.

ps: you could post or email your reponses, i am reading this group almost everyday now :)

I did uncompress, and then did
tar xof arp68k_book.tar
It worked fine for me.
I wonder if there was something wrong about the file mode you
used. Before you do the file transfer, try typing
binary
That should improve things for you.

Source record: 220415

Even though I'd prefer to stick with Atari, it looks as if I'll be picking up a Mac powerbook 140 sometime. Does anybody know (or have any thoughts) about whether I'd be able to use my SC1224 as the 140's external monitor? All I know about the 140 is that it has 8-bit color built in.

Anybody?

ANYBODY?

BUELLER?

I don't think you will find any support for ESDI hard drives, so trade it in for a SCSI one...

Regarding GEMulator, Leo Hendry asks:

>The big question is does PC Ditto work on it, and of course, does it work
>under PC Ditto?

I'd imagine pc-ditto (the original software PC emulator) would work on
the GEMulator.. but why..?

And, naturally, GEMulator won't work with pc-ditto, since GEMulator is
a combination hardware/software product for the PC, and pc-ditto, both
the software only, and the hardware versions only emulate PC software,
not PC hardware...

But why would you want to run an ST emulator under a PC emulator on
an ST..?

>This might sound like a stupid question but I am asking it anyway.
>What version of TOS is Rainbow TOS (I had a piece of paper about it but
>it got lost:-).
>Also, what difference does the version of TOS you have make?
>Is there some kind of major speeding up or what?
>(I told you this was a stupid question)

1. There are no stupid questions, only stupid answers. :-)

2. TOS 1.04 (on "normal STs") and TOS 1.06 (on earlier STEs) are called Rainbow TOS because of the rainbow appearing in the Atari logo when clicking on DESK/Info.

3. There ARE big differences between the TOS versions.
If you have a hard disk, you should run at least TOS 1.04 (or TOS 2.06) because in TOS 1.00 (from '85) and TOS 1.02 (from '86/87) the GEMDOS disk routines are simply SLUGGISH! Besides TOS 1.00 and 1.02 have some fatal bugs which could damage your disks or hard disk under unfortunate circumstances.
From TOS 2.0x on there is an improved desktop. For instance, you can create your own icons and move programs to the desktop which was impossible before.
TOS 2.06 runs on any ST/STE machine with 68000/68010 or 68020. (and lots of more extras)
If you want to run TOS 2.06 on an ST you have to buy one of those extension cards, and that's all. On an STE and Mega STEs it is enough to change the ROMs (if I'm right...)

>Having read so many articles about the HD floppy drive attached to
>an MEGA STE, I wonder about updrading to 2.06.
>Besides of the possible 1.44 drive problems solved(?),
About the 1.44 drive problems I don't know for sure. But the most important thing is to get a new FDC chip that can handle HD-drives if I'm correct.

>I wonder what is new in that version.
Lots. The RTS/CTS bug is fixed, only very FEW modems still have problems with it, but a program called RS232ENC from Michael Bernards fixes it for good.
You can enter any ASCII code by holding the ALT-Key and typing the code on the Num-block (same as on PCs).
TOS 2.06 runs on 68000/68010/68020 processors.
I/O redirection is correctly implemented.
The OS waits for any hard disks conected to the system and supports AT-bus disks (mainly for the ST Book).
... and some bugfixes
(I don't know what else, but there are some more "features")

And please do not forget the things that do not longer work:-)
Nope! Whatever runs on TOS 2.05 will run on TOS 2.06 for sure. The times when a change of OS versions caused problems are gone. (They _might_ reappear when MTOS is finally released, however. :-( )

Source record: 219944

> well there are rz/sz .ttps on atari.archive... but has anyone tried
> compiling the `normal' un*x zmodem sources with MiNT libraries? could

somewhere on A.A (i dont have ftp access to tell you exactly
where) there should be MiNT friendly versions of rz/sz. it is NOT just
a matter of re-compiling the TOS ports with the MiNT library, the MiNT
friendly version were modified to take advantage of the fact that it
had MiNT underneath it. also, mgrterm (withs both with and without
mgr) which is a MiNT friendly terminal emulator should be there.
without mgr you get ascii menus, with mgr you get nice
popup/pull-right menus, it has dialing scripts, escape to shell,
suspend etc etc.

cheers,

6836. TT fastram upgrading from 4 to 16 MB

Newsgroup: comp.sys.atari.st
Date: 1992-06-27 14:23:20 UTC
From: micha@moko.saar.de
Message-ID: <H.h9htBskJ2a6@moko.saar.de>
Source record: 220431
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I've a problem upgrading my TT fastram board from 4 to 16 MB. It's copyright Atari Corp., No. CA401058-001 Rev. B. All SIMM modules are in sockets.

I've changed all modules from 1 MB * 8 Bit to 4 MB * 9 Bit, the pins for Bit 9 are not connected. The jumper settings are:

```
W W W W W W
1 1 1 1 1 1
0 0 0 0 0 0
1 2 3 4 5 6

F F R R F F
```

F = front, R = rear

W103 = base address is set to 0x1000000
W104 = dto.
W105 = burst mode disabled
W106 = controler is set to 16 MB (instead of 4 MB)

This configuration works fine on old and new TT versions. But in some cases, there are bus errors or more bombs. Some programs which work in 4 MB mode, don't work in 16 MB mode, some other get problems everytime in the same situation.

The memory check (TOS 3.06) accepts the 16 MB configuration.

The chips on SIMM modules are NEC 424100-70.

Any ideas???

The computer store I normallly deal with is having trouble finding
this game. It seems that North American supplies for ST software
are drying up.

I'm interested in finding either a new or used copy of << Lemmings >>
for my Atari ST. If you've seen this game on some store self or are
tired of playing it, drop me a note with an address of how I might
find it.

If any European suppliers read this, please state whether you have
North American copies that don't require a 50/60Hz loader. (The
subliminal flicker can be very tiring for the eyes during extended
play.)

From: richardson@vaxr.sscl.uwo.ca
Message-ID: <1992Jun27.150433.1@vaxr.sscl.uwo.ca>
Source record: 220423

Hopefully someone out there in net-land can help me! I recently went to change the activation keys for "Revolver" and I can't seem to locate the program that does it (I seem to remember it's called 'Revact' or similar). I don't know if it infringes any copyright to send this program since it's not the actual program, more like a 'fix' for the key-change, but if some kind soul could stretch to sending me a copy of 'Revact' I would appreciate it. When I backed up Revolver I didn't bother doing a disk-copy but just copied Revolver.prg and the .sys and .inf etc. files...at the time I remember thinking Revact seemed useless...OOPS! I just can't locate my original copy...I can't find my copy of "Resolution 101" either, but I didn't think much of it anyway so THAT's no great loss. With the recent acquisition of Codekeys and Multidesk however I need to change the activation sequence for Revolver to something less obtrusive! Thanks in advance for any help,

John.

It's a bit too much too explain the capabilities of tcsh in a posting.
You should read the docs of csh and tcsh and become familiar with Unix
shells, if you want to use most of its features.

> I've been having problems with emacs 3.10 with Gulam under MiNT.
> I only have to do a few edits and the machine (TT) freezes up. Which
> emacs were you refering to?
I was talking about a private porting recently made by Stefan Schober
(stenny@troja.stgt.sub.org). It was Version 18.57 of GNU emacs, if I
remember right. This one works only in a MiNT environment. We'll put
it on ftp.uni-stuttgart.de in a few days.

6841. HiSoft Forth for the Atari ST

Newsgroup: comp.sys.atari.st
Date: 1992-06-27 20:32:42 UTC
From: reynolds@panix.com
Message-ID: <1992Jun27.203242.6469@panix.com>
Source record: 220424
Cross-posted to: comp.lang.forth,comp.sys.atari.st

Has anyone had any experience with HiSoft Forth on the Atari ST? I saw it mentioned in a mail order ad recently. According to the brochure someone at the store read over the phone this is based on Forth-83 with support for the Atari OS and graphics, multitasking, and a Motorola syntax 68000 assembler. There are other features, but I can't recall them all off the top of my head. Can someone tell me the phone number of HiSoft (or their distributor) in the US? Thanks for any information that you can provide.

They're the same thing! "1.62" is the actual contents of memory, and is
therefore sort of in hex. Figure out 0x62 in decimal. I'd say the TOS
version programs you have are pretty bad.

The price you quoted for the STE system, did that include the Notator Program,
but this price is a BIG RIP OFF, here in NZ you can get at a Sale price
the STE 520 + SM124 for less than $1000nz = $500us, the SIMMS to make it 2 megs
are some $180nz = $90us but can be got for as low as $60us for the 2...

Even at Atari list prices here you are looking at about $1800nz = $900us, and
out Atari prices here are very high for computers here...

No you can't use a EGA monitor, there are other Atari monitors like SM125,
SM144 and SM147, I think that the SM147 is ment for the TT, not I don't think
you need a Hard Drive and be carefull on that printer, does Notator have a Print
Driver for it..??

Ive been reading some messages here about a uucp suite called Hermes,
and am curious about it. Where can I find it, first off? And whats
its capabilites?

A while ago, I found something called Mercury, which looks to be a
pretty complete suite of programs for UUCP, mail, and news. But I
havent had any luck running it. Most of the docs are German, but theres
an English translation that pretty much covers everything. The machine
I am posting this is thoth, and is located downstairs, so I set all my
sys and hosts and paths entries to route to thoth, and tried to send
mail to me azog@thoth. First, the editor I declared, Elvis, even tho
I have the TERM variable declared, doesnt seem to like being called
from within another program.

Secondly, when I send the mail, mail (or elm) reports something to the
effect of input file not found, and dies. Doesnt tell me *which* file
I cant find, tho!

Any help? Not that important, as I have a real Unix machine, running
real HDB UUCP, and all the rest, but it would be fun to try. Thanx

6848. Details on Ajax install (needed...)

Newsgroup: comp.sys.atari.st
Date: 1992-06-28 02:01:23 UTC
From: cummins@a.cs.okstate.edu
Message-ID: <1992Jun28.020123.2084@a.cs.okstate.edu>
Source record: 220429

I'm putting an Ajax chip in my Mega ST, and realize I need software and a doubled clock for using the Ajax at 1.44MB

Can someone post or mail details on a proper clock signal for the Ajax chip? I need to know which pin(s) of which devices I can pull the clock signal from!

I thought I could find this info on Atari.archive... BUT I couldn't.

jc

Source record: 220448

Well a person just rang me to-night, just out of the blue and asked for some help.

Has a Star LC 10 colour printer, and uses Hyperpaint/Neocrome and Paintworks, and would like to print out the colour pictures...

What would be the best way to do this, I don't think any of those program have support for Colour Printing, any Ideas..

Are there any good shareware/pd programs that can do this, ie, import a number of colour file formats and be abel to print them, in colour that is..

Roger........ sheppard_r@kosmos.wcc.govt.nz

> to do with system ??? this was the German 1.06 version..??

No, I don't think so. V1.06 includes conneng.rsc (there are still some
german sentences inside, but only one or two). Perhaps you have one of
the terible earlier versions...

>TOS 3.0x - TT TOS visually identical to 2.05/2.06 (or vice versa) but for
>the TT machines only.
[stuff deleted]

No, TOS 2.06 is definitely NOT only a bug fix for TOS 2.05. It was specially designed to work with any ST/STE machine, while TOS 2.05 works with Mega STEs only. Besides, some features have been added (refer to my article about differences between 2.05 and 2.06).
The reason Atari developed TOS 2.06 was simply that some people developed an extension card which made it possible to use the 256K ROMs in older STs as well.

You DO NOT port assembler to UNIX-boxes, that would mean to reinvent
the wheel over and over again. You produce portable C-code.
On the Atari this may be slower than assembler, but as long as I am
working a lot on my UNIX account I really don't care, it's fast enough
anyway. Almost no-one uses assembler on UNIX-boxes anyway.

This is why I use zoo, but if someone could point out somewhere or
some name I could search for with archie, I would be glad to get
lha201 for UNIX.

PLEA :::

Please, Please do not lharc msa-files like PYM, it's a pain in the
ass for those of use with 1M and 1 disk-drive, to first unlzh and then
unMSA the bitch. If you have to use an archiver (I have no idea why)
please use zoo..... (Then I can unzoo it on my account before
transfer.)

Jarle.

Erm.. As I've said in another message in this thread I have an ST that
uses PQFP versions of MMU and GLUE, these are purpose designed SURFACE MOUNT
components and as such are ALWAYS soldered to the motherboard.
The PLCC versions can either be surface mounted or socketed, it doesn't
really matter too much..

In any case, your statement that 'the MMU is never soldered' is quite simply
wrong.

It probably would be, if someone cares to write an ST version.
According to the docs that come with ARJ on the PC, the availability of
source code is 'very limited'. An older version even said something along
the lines of 'only to large companies' etc.
If you can get the source out of the author then OK, but otherwise who wants
to do a complete (compatible) rewrite from scratch ?

> whatever it is) that works with Spectre GCR is???

No, but....
Speaking of System 7.0, do you want to know how to bring it to its knees? On your high-density equipped Atari :-), format a disk to be twenty sectors per track. (Pumpup by Claus Brod works for me) It reads and writes fine, yes? Now stick that floppy in any Mac running System 7.xx. Goodnight, ladies, it's time to say goodnight. Kablooie. Guaranteed to stop any Mac program in its tracks including, but not limited to, Apple File Exchange, Access PC, DOS Mounter, and darn near anything that runs under 7. Bwahahahahahaha!!!
The Macintosh (tm) IMMEDIATELY bombs as soon as that disk hits the drive. Everything stops. Tired of that "Drive A not responding" message?
Treasure it. It's a heck of a lot better then crashing your entire system.

I think TOS1.09 is different from TOS1.2 (Which has been renamed to 1.02 because the the minor version number is $02 hex and to call it anything else would be inconsistant with $62 being x.62) I think V1.09 is basically V1.00 with blitter support and was only released in Britain and then only for a short time.
Herwig is completely correct in what he says.

>will have to get its finger out to get better machines as these.
>
>The A5000 the New Acorn RISC Home computer that multi-tasks and runs Unix.

The A5000 doesn't multi task properly - it relies on software calling the
OS frequently to allow it to switch tasks. GEM has always been able to do
this and will soon offer true multitasking.
The A5000 can only run UNIX in theory, only Acorns Rxxx machines come
with UNIX installed.

>Acorns machines have been runing Unix for some years now,
>and has some 26 mips performance..

The most powerful Acorn computer does 14 Mips.

>Acorn even make Unix Work Stations, the R140/160 from memory,
>and take note Atari, all from a company of just 120 people...

I don't think Atari have any more people than that actually developing
products, probably less.

>Acorn knows how to get its act together, they even have a office here in N.Z.
>Atari does not...

Many people in the Acorn world will tell you they are frustrated with Acorn's
pricing and advertising policies which they feel holds back the potential
of their computers.

>There new Archemides A5000 cost less here than a TT, and the A5000 comes with a
>mult-sync monitor, the TT does not, A5000 is $4500nz the TT $5200nz with out
>monitor...

You forgot to say that the A5000 is at least 1.5 times the speed of a TT.
However even the A5000 cannot compete in terms of price/performance with a
'486 IBM clone.

>So does that meen that these new Apple Note pads are going to be that fast..

You'll have to explain that one to me.

>since I want to interface it to my Amiga. Ant info about it
>would be helpful.

Well, it really is not possible to control the SLM804 from your Amiga, so if you sent off a check I'd call back and cancel your deal...

The problem is that the Atari LAser Printers (SLM804 and SLM805) use an entirely different scheme for page formatting and storage than normal parallel-port laser printers (such as the HP Laset Jet III for example). Where a Laserjet has megabytes of its own private memory and is essentially a computer in its own right, the Atari laser printers are basically just the print engine. This means that the computer does as the formatting and must store the page in the system RAM (which eats up your memory, usually at least 2 MB is required), and the printer is just a slave. The result is a very fast and cost effective laser printer (although you can get a normal laser for about the same price now) --- the catch is that it can ONLY be controlled by an Atari with the correct DMA-interface and printer driver. (well, ok, it woulf be possible to hook it up but it would involve a complex hardware interface and a complex software driver which you would be hard-pressed to write yourself).

So, the answer is that you can't use the SLM804 with your Amiga.

The system you described could easily be found for $600-$700 at U.S.
stores mail-order, so if you have the chance it would probably be
well worth the hassle to buy from he U.S. I wouldn't bother trying to
find a used 520STe, most people who are selling Ataris are selling
STs or Mega STs.

>
>another thing, can we really run notator without a harddisk? i mean,
>how can we right? where can i store my sequences without a harddisk?
>and how big a disk should i get and how much would that cost? the
>guy at the store said i do not need a disk...but what do YOU think?
>

Well I don't know Notator but you probably can run it from floppy.
Depending on the magnitude of things you will be doing, you may find
that a hard disk gives you a lot of added flexibility, performance, and
convenience for a reasonable price. (There are a lot of U.S. stores
selling 50 MB drives in the $400 - $500 price range) This would
probably be adequate for your needs, especially if Notator is the only
major program you have on it.

>also, i want to be able to print music scores on my laserjet 3p printer
>and the guy says this is an easy thing to do. has anyone tried doing
>this and did you need any extra hardware/software to make the connection?

All you need is a parallel cable and a printer driver (which is
undoubtedly supplied with the program you use to print scores -- I guess

Notator probably does that). You have a common printer so it's
probable the driver for it is included.

>
>also, can i use an EGA monitor instead of the sm124 (i already have an

>this is a hard decision...but one that i must make soon...thanks!
>

Nope, you can't use an EGA monitor. You can choose either Atari
monochrome monitor (SM124 or SM147), which is probably a good idea
since you can then use high-res monochrome for your sequencing and
notation. Or, use the Atari color monitors (SC1224 or SC1435), although
I have no idea whether Notator runs in medium res -- be sure to check
on this before deciding on a monitor. Another option is to get a
multisync monitor like the NEC 3D (about $400), along with an adapter box
(about $50), then you can do monochrome and color on the same monitor.

System 6.0.5 runs quite stable, 6.0.6 and 6.0.7 should run if you
disable sound output.
I recommed using 6.0.5. Without a hard disk, Mac OS is no fun at all.

Regards, Markus.

6867. Re: CLAB Notator Questions

Newsgroup: comp.sys.atari.st
Date: 1992-06-29 03:52:36 UTC
From: bmaraldo@watserv1.waterloo.edu
Message-ID: <BqL9Fo.DJn@watserv1.waterloo.edu>
Source record: 220366

I am a professional musician who uses Notator in my music studio for
sequencing and music publishing. I may be of some help...

In article <52170002@hpsgm2.sgp.hp.com> nunis@hpsgm2.sgp.hp.com (Simon Nunis) writes:
>anyway, i still have some questions i need answered before i go and
>spend my hard money...the system he suggested was a 520ste with a
>2mb upgrade of memory and a sm124 monitor. this system would cost
>me S$2,790 (that's Singapore dollars, which comes up to about $1,800
>US dollars at an exchange rate of US$1:S$1.62). so how does the cost
>add up? does this sound like a reasonable offer? can i get the same
>thing for less in the US? how about a used one?

That sounds hight to me. Last time I checked new atari prices,
the system you described was around $700 Canadian ($1us = $1.18CDN). You
can get used systems for considerably less. In fact, you do not need a
2meg STe to run Notator. An old 520 with a 1neg upgrade or a 1040 are all
that are needed and at least one double sided drive. I sold a 1meg 520
with drive and mono (sm124) monitor for $150CDN (this is not uncommon)!!!

>
>another thing, can we really run notator without a harddisk? i mean,
>how can we right? where can i store my sequences without a harddisk?
>and how big a disk should i get and how much would that cost? the
>guy at the store said i do not need a disk...but what do YOU think?

Yes you can. I do (I am hoping my deal on a 30med HD goes through).
I have been running Notator 3.2 on a 520 with a double sided drive. It takes
a bit longer to load but runs just fine. All of Notator will fit on a single
disk (about 600k of file space) so even the smallest HD will work.

>
>also, i want to be able to print music scores on my laserjet 3p printer
>and the guy says this is an easy thing to do. has anyone tried doing
>this and did you need any extra hardware/software to make the connection?

I am a music publisher and use a Panasonic laser emulating an HP
with Notator and it works just fine. I use Calamus to do the headings
and title pages but Notator will work as well. I do not see a problem
using the 3p (an HP?) with Notator, all the drives are on the disk.

>
>also, can i use an EGA monitor instead of the sm124 (i already have an
>EGA monitor :)) well, i think i would really like to have notator
>because i really like the fact of having a sequencer and a notation
>program in one package...so, do tell me more of your experiences with
>this great program...and really...i would like to hear pros and cons,

>this is a hard decision...but one that i must make soon...thanks!

Notator, in my opinion, is the best music sequencing software available for a commercial home computer. I use my system professionally on a full-time basis so it has to work and work well. It does. I do say this to people, though, 'I would own a Mac if it wasn't for Notator and Calamus.' A Mac is a better computer over-all but Performer just doesn't stack up to Notator. The notation printout is publisher quality, unlike most notation/sequencer packages (thank god they fixed the slurs). Notator/Creator are the best. You may not need the best. I use only about 30% of Notator's sequencing capabilities - the tools are them but I just don't use them for actual work. An atari or mac with cheaper software might do you fine. I can't without Notator simply because of the steamline user interface and notation.

>
>simon.
>
>ps: you could post or email your reponses, i am reading this group
> almost everyday now :)

There you have it. If you have any more questions please ask.

Brett

ps. I have 6 recordings out that were done with Creator/Notator (some work with Pro 24 when C/N wasn't available). By the way, Pro 24 might do you just fine. What are your bottom-line requirements?

6868. Programming/Developing resource text-files

Newsgroup: comp.sys.atari.st
Date: 1992-06-29 04:39:12 UTC
From: aa620@cleveland.Freenet.Edu
Message-ID: <1992Jun29.043912.20460@usenet.ins.cwru.edu>
Source record: 220367

Hi,

The Cleveland Free-Net Atari SIG Operators are working on
a new version of the SIG. We plan to release it within the next few
days and will post info on how to access it for those that do not know.
The last part of the SIG that we are trying to get together are
the mini "Programming/Developing Forums" within each system support
area. Inside this forum, we are trying to get together programming and
developing resource files that will be helpful to users.

If you have any documents, tutorials, or any other text-files
that may be of help to us, please send them to this mail-box.
We already have the "ProGem" series so please do not send them.

We are creating these forums for you and hope that everyone
that has access to telnet will use them. We hope that you will help
us make these forums better as time goes on.

Thank you for your help.

Sincerely,

Len Stys
.

6870. trouble using gdos/slm804

Newsgroup: comp.sys.atari.st
Date: 1992-06-29 06:09:31 UTC
From: marc@targon.UUCP
Message-ID: <2466@targon.UUCP>
Source record: 220374

Hello netland,

I'm looking for some hints to help me get documents printed on
an slm804 laserprinter using gdos. As far as I know my assign.sys
is set up correctly, i.e. the path to the fonts and the slm804.sys
are valid, and gdos is resident after booting (I tried several versions
of gdos, like gdos1.1, amcgdos, nvdi).

Programs that use output.* mostly crash even before an attempt is
made to start printing; sometimes the box 'Now printing...' apears,
after which it crashes, and sometimes I'm as lucky to get one single
sheet out...
Timeworks publisher often prints normally the first time, but when
I try to print the same testpage, I get the error 'Printer driver
not found'.
Touchup has the possibility to print directly from the program (not
requiring output.*/gdos, but says 'Laser printer error' (!).
The diablo emulator just seems to work fine.

Has anyone any idea what can be wrong here? What acsi address uses
the slm804? Can it be some clash between the slm804 and the icd
scsi hostadapter (with hard disk at lun0)? I have also seen sense
codes 7f and 24 a few times.

Any help would be appreciated greatly; please reply by email.

6878. MiNT & logical GEMDOS drives ?

Newsgroup: comp.sys.atari.st
Date: 1992-06-29 09:46:59 UTC
From: itschere@techfak.uni-bielefeld.de
Message-ID: <1992Jun29.094659.14342@unibi.uni-bielefeld.de>
Source record: 220314

Hello world!

Has anyone out there the slightest idea how to prevent (!!!) MiNT from recognizing some logical drives?
The point is that if you'd really like to run a multi user system and do install a minix partition to have the full access permission stuff, how can you block the other drives for some users? Perhaps :-) its not a good idea that a second /dev/ttya client is able to start gem programs?!?
I can block these effects on the minix partition by using the access permissions, but I cannot take away the read & execute permissions on other (normal) drives, so what can there be done?
Several tries with erasing the u:/c or making a symbolic link from u:/c to nowhere to prevent the original drive to be accessed or renaming u:/c to anything which can't be accessed haven't lead to anything which looks like success.
The only way it seems to be possible, is to manipulate the _drvbits system variable, then the drives won't be in u:/ but how should MiNT boot up the minix.xfs then???

a desperate TeSche

You need to set the `ku', `kd' etc. termcap entries to refer to the codes that
MiNT assigns to the cursor keys. By default, MiNT sends the VT52 sequences for
`cursor up', `down', ...
This will work only for MiNT >= 0.94.

Greetings,

Jens.

Just curious - what program is telling you that you have TOS 1.98? As far as I know, there is no such thing. But as a message mentioned before, 98 decimal is 62 hex, so the program may be showing you the decimal version instead of the hex version. (i.e. TOS 1.62)...

The reason for archiving the MSA is for better compression, and inclusion
of a document not on the original disk. ZOO will do the job fine,
as will the other archivers (with less portability).

On the weekend I tried to E-mail info out to various people who contacted me after I requested info on FTP sites. Must have had a rubber band network because most of what I mailed out bounced back.

Briefly:

Ralph, I cannot send you GCR 3.0 to upgrade your 2.65. The upgrade is commercial, not freeware, and you will have to buy it from Gadgets. Sorry!

Hurwitz, I have been very happy with my Reflex card in my Mega4ST. For Megas, the board simply plugs in. The hardest part is opening up the Mega (i.e. taking out 8 screws and lifting up the shileding). The operation is quick and painless. If you want more info, please send me a hardcopy mailing address and I'll send it to you.

As for those who wanted copies of the FTP site lists I received, I'll post a compilation in my next posting to the net.

6891. Re: New Randplay Version Is Here (long)

In article <1992Jun29.082712@lssec.bt.co.uk> msmith@lssec.bt.co.uk (Martin Smith) writes:
># This is a new release of the RANDPLAY sample playback program
># which appeared in the binaries group recently.

Just out of curiosity, why did you post this in comp.sys.atari.st as
well as in the binaries group? UUencoded posts cost a lot of money;
see news.lists for the staggering statistics.

From RANDPLAY.INF, in the archive:

># RANDPLAY.INF file last edited MHS 23/1/92. Beats PLAY.PRG by miles !

Oh really? Then how come you can't play STe stereo samples at
arbitrary sample rates? Nyah-nyah! :-P :)

Thanks to some feedback from Ed Krimen, there's a new version of QD
Play sitting in the atari/new directory on atari.archive. Of course,
you can't download it until Jeff checks it out and puts it in newitems.

Subj: RE: FTP sites

There is a few good FTP sites, and alot of little ones.
The best is atari.archive.umich.edu and you use FTP as name and
USER as the password in lower case of course. A great one for
demos is ftp.uni-kl.de and you login the same way.
What system do you have, and what are you looking for? I
think you will like umich, it has alot of stuff.
Are you familiar with ARCHIE or have you never heard of it?
It is a good system for locating files. E-Mail me anytime for help
if you need some.

---------- cut here ----------

Atari Netters,
Here is my revised list of where to get your bargain
PD software around the world. As before the list only contains
sites of real (no offence to smaller sites :-) significance.
There are a couple of new sites, and some corrections. The
list is not necessarily still, bug-free so to speak, but i'm
almost postive it is. All the usual rules about not being
responsible if you burn your hand in a toaster while reading
this and attempting to get compensation off me apply, funnily
enough!

A plea to all those of you who spy a mistake, addition
or even feel as if this list could be improved, such as a
mickey mouse logo, type comments are more than welcome.
Send all flames, etc. to.....

woocm@essex.ac.uk

That's me by the way!
ENJOY!!

Tried to E-mail you directly, mail bounced. E-mail me your hardcopy address and I'll send you info about the Atari products I sell. Re: other requests, please do not ask me for info about my company's Atari products on the net. I do not want to get in trouble posting commercial stuff. You can, however, drop me a note or a postcard addressed to Greg Csullog, BOX 1966, Deep River, Ontario, Canada, K0J 1P0. That's as commercial as I want to get!

|>
|>

On the contrary, the Adaptec board probably does what he says: it supports an ESDI drive off of a SCSI bus. What roger says would then mean that ST506 type drives don't work on ataris, while we know that all the original atari drives were just that: atari->ICD (or whatever)->SCSI->adaptec->ST506. So what is wrong with: atari->ICD (or whatever)->SCSI->adaptec->ESDI if you have the right adaptec board? Nothing of course. I am currently running a 160 Meg VERY FAST ESDI drive off of my atari. I can't help the original author, though, because my board is an Emulex instead of an Adaptec.

Wow, does Roger spew out tons of messages or what? Please don't fill MY newsbox with so many quick (but often incorrect) replies. Flames elsewhere...

To the original author: if you can get the ICD adaptor to recognize the Adaptec board (as you probably can) I can help you to figure out the parameters needed for your drive in a relatively efficient way. Mail me if that is the case, you'd like some help.

Details?

I just saw a series on DSP in general in the German mag ST Magazine.
May be Atari really are going to put a DSP in the Falcon.

I tried your prgram on my TT the other day, it ran but I couldn't
get the hang of it in the short time I tried it
(I only tried it for a short while - I'm interested in
it becuase I fancy doing a similar thing for metabolic pathways), for one
thing the icon buttons are not clear on my TT monitor (mono mode) -
the Atari TT monitor is not very good and is very expensive. Also
I found it difficult to set up inputs (but eventually made it) and
couldn't get any outputs to show from a single AND gate I tried. I think
I need to go back and have another go.

> there future versions planned) ?

Heat and Serve C, which is derived from Sozobon, is most definitely
supported, and a new version is in beta testing right now. It
includes ARGV support and a major upgrade of the GEM libraries,
with many new high-level functions. The documentation for the
new GEM functions runs about 80 pages.

For now, get atari/programming/sozo133i.zoo from atari.archive.umich.edu.

>Thanks to some feedback from Ed Krimen, there's a new version of QD
>Play sitting in the atari/new directory on atari.archive. Of course,
>you can't download it until Jeff checks it out and puts it in newitems.

I've just been informed that you actually can FTP stuff from the new
directory on atari.archive, provided you know the exact filename.
Since it's been a few weeks since I sent it up, I'm just going to go
ahead and announce the new Play so you guys can all download it and
disassemble it in an attempt to make it better. (Oooooh!) Just
kidding, folks, just kidding.

Anyway, the right pathname is:

atari/new/play30.zoo

It's about 80K.

The doc file is included below; it describes what's new.

```
*------------------------------------------------------------------------*
This is the first release of QD Play that is not completely backward
compatible with prior versions. The PLAY.INF parsing routine has been
completely rewritten to allow all valid command line arguments to
be given in the .INF file as well. This corrects some serious
brain-damage in earlier versions; thanks to Ed Krimen for reminding
of the problem.

The main result is that blank lines and the old {name} specifiers are now
prohibited in PLAY.INF. Now PLAY.INF lines are identical to command lines
(except that the command name, play, is omitted). See the docs for more info.

Dave Baggett
Internet: dmb@wam.umd.edu
June 12, 1992
*------------------------------------------------------------------------*

play.doc (excerpt):

*------------------------------------------------------------------------*

AUTO Folder usage
-----------------
```

[...] create a file called play.inf with a text editor containing
lines that are just QD Play command lines. E.g.,:

```
deadjim.snd 18000
deadjim.110 11000 -v -l -hippo
stereo.125 10000 -2 -d
```

NOTE: There can be no blank lines in the file. QD Play picks a random
line of the file; if that line is blank no sound will be played. Similarly,
all options for a sound must go on a single line.

There is no limit to the number of lines in play.inf.

Specifying an Alternate D/A Device

The following options select the various supported playback devices:

```
-hippo: use Hippo digitizer
-replay: use ST Replay digitizer
-ste: use STe sound, using MFP for timing
-dma: use STe sound, using DMA for timing
```

All these except -replay can be abbreviated by their first letters. The
-replay switch can be minimally abbreviated to -re to distinguish it
from the -r (reverse) option.

Other Exciting Options

The -q option will prevent QD Play from printing its cheerful greeting
message. For example,

```
play d:\usr\sounds\attack.snd 11000 -q
```

will play attack.snd without printing a blurb.

Similarly, the -v option forces QD Play to print its message even
when its run from the AUTO folder.

The -r option will cause QD Play to play the sound in reverse.

The -l option tells QD Play to loop the sample either 5 times or
until a key is pressed. You can also specifiy a number of times to
loop; e.g, -l15 will loop 15 times or until a key is pressed.

CAVEAT: Do NOT try this with samples faster than about 16 kHz using the
ST speaker for playback. Beyond 16 kHz the sample playing interrupts happen
so often that they make the TOS keyboard handler flakey, which often results
in TOTAL SYSTEM LOCKUP. (And lots of bombs and other cool stuff on the
screen.)

The -2 option makes QD Play interpret the sample data as stereo, where
alternating bytes go to the left and right channels. Note that you can play
stereo sounds on any device, but on mono devices the two channels will be
mixed. This usually sounds bad if the stereo sample has panning effects.

The -z option tells QD Play to interpret the sample data as
signed magnitude instead of the standard (as far as I'm concerned
at least) unsigned magnitude. Some sample editors use signed and
others use unsigned -- it makes no difference in terms of sound
quality, but it's really annoying if you don't have a sample player
that supports both. If you play a sample and it sounds really noisy,
try the -z option -- you may have a signed magnitude sample on your hands.

Command Line Usage Examples

Since QD Play's many options can be a bit daunting at first, here
are some examples to get you started quickly:

play chord.110 11000

Plays chord.110 at 11000 hertz through the ST speaker, using
the MFP for timing.

play stereo.125 12500 -2 -d

Plays stereo.125 at 12500 hertz through the STe 8-bit D/A using DMA,
treating the data as stereo.

play stereo.125 10000 -2 -d

Same effect as above. If you don't pick one of the STe DMA device's
four preset playback rates, QD Play will pick the closest one for you.

play stereo.125 10000 -2 -s

Unlike the example above, this command will actually play the
stereo sound at 10000 hertz, not 12500, since the -s option tells QD Play
to use the STe 8-bit D/A but to use the MFP for timing. Sound quality
is not as good with this method, but unlike the -d option (DMA sound device
timing) it offers playback at all sample rates.

play signed.080 8000 -z -re

Plays signed.080 at 8000 hertz through the ST Replay digitizer,
treating the data as signed magnitude.

play stereo.125 8000 -2

Plays stereo.125 at 8000 hertz through the ST speaker. The data
is interpreted as stereo, but the two channels are mixed to produce
mono data suitable for the ST speaker (since the ST speaker can't
play stereo sounds).

play deadjim.110 11000 -q -l -hippo

Loops deadjim.110 at 11000 hertz either 10 times or until a
key is pressed. No greeting message is printed, and the Hippo/Navaron
digitizer is used as the output device.

play rooster.080 8000 -r -re

Plays rooster.080 at 8000 hertz in reverse through the ST Replay
digitizer. Note that the -replay option can't be abbreviated to -r
because -r means "play the sample in reverse."

play chord.110 22000 -l

If run on an unaccelerated ST, locks up your machine. 22000 hertz is
too fast for a looped sample on an unmodified ST. Keep looped samples
down below 16 kHz to be safe.

History

[...]

Version 2.0 was the first to include support for STe's enhanced
sound capabilities. Other options were added, too, including
looping and signed magnitude sample support.

I totally redid the play.inf parsing for version 3.0, so that
all the command line options now work from the AUTO folder. The loop
specifier is also new to version 3.0. Stereo mixing is fixed for
mono devices as well.

6899. Printing from Spectre???

Newsgroup: comp.sys.atari.st
Date: 1992-06-29 16:43:45 UTC
From: paul@jupiter.noname
Message-ID: <1992Jun29.094346.3409@arizona.edu>
Source record: 220396

This is my story:

I'm running Spectre GCR 3.0 on a TT. My problem is that I have no way to print from Mac mode without taking the file into my office (I have only an Epson-type dot printer, and I'm too cheap to get a specific Mac printer driver ["But if you can afford a TT?"--don't ask])

Anyway, last week I downloaded ghostscript (which, in itself, works fine) with the intention of priting Mac postscript files with it. But then I found that Mac post-script files are "ill-behaved" and indeed ghostscript won't touch them. I got a Mac program from mac.archive.umich.edu that said it would clean up Mac ps files, but is crashes Spectre. I'm about to give up and just wait until I can afford a laser printer (I figure, "Hey, I don't print that much anyway....").

But does anyone know of a (cheap [free]) solution to this problem? I'd love to hear it. :)

Paul Harris

Folks,
I am new to this net. I have an Atari 1040 st, but here in Albany NY there is not much support. The only store that carried any ST products just went out of business so I am left virtually alone. Any ideas where I can get mail order help? Also are there any good national magazines that will help me learn more about my new machine? I'd appreciate any help you more experienced users could give a beginner. Thanks, JH.

>What makes you think the program is sub-commercial?

The term "sub-commercial" is not meant to imply imply a lack of quality, I have defined it in the past as a program for which the author expects money for a working copy UP FRONT, yet is unwilling to advertise the program in a commercial manner.

You should check the advertising in magazines such as ST INFORMER and ST ADVANTANGE. I have regularly seen advertisements from DoubleClick, Gribnif, and other software houses looking for new products to distribute.

>As for using correct words, I don't see your point. A Shareware program
>is meant to be viewed and examined before a purchase is made. If the
>program is restricted properly, the limitations will not interfere with
>the users' perusal of the product.

A "Shareware" program, as defined by its creators, is not RESTRICTED in any manner.

A "Demo" program imposes restrictions while giving a potential user the chance to peruse the product features.

Call your program a "demo", just don't call it "shareware". The implication of the term "shareware" is that I will be able to use all of the program's features (and, perhaps, additional features offered to registered users) before deciding whether I want the program enough to pay for it.

The implication of the term "demo" is that the program has restrictions, and I can only obtain a fully functional program when I purchase the 'real' program.

IF there is a shareware fee required for use of Lharc201, then I would request that NO ONE use this particular program to archive programs, since I am opposed to the use of any archive program which requires the user to PAY FOR THE PROGRAM that does the unarchiving!!!

Use XLharc instead. Who cares if Lharc201 gives better compression if it's going to cost each and every user money to unarchive programs?

There is a set of free epson printer drivers called "Chuck's printer drivers."
It can be found on the net via ftp from mac sites. It works fine.
There is a unix program that fixes the headers on the postscript files to
make them work properly. I am sure there would be no problem porting them
to run on the atari, as it is only a simple command line filter. The name
is Macps, and I use it regularly to print mac postscript files from home.

Good luck.

The good news is that both CIVILIZATION and B-17 will be released
for the ST around the end of September.

The bad news is MicroProse shortly thereafter will be joining the
long list of companies who no longer support the ST. --Which is
a shame: arguably the consistently best software for the ST
had the MicroProse name on it.

(I got the above info from a MicroProse (UK) rep a few days ago.)

Message-ID: <Jun29.190757.56078@yuma.ACNS.ColoState.EDU>
Source record: 220254

The Mac postscript file has two types, one by command-F and the other by command-K, the difference is whether to including the define header used in Mac's postscript. However neither one can be printed directed to a Postscript printer as the header is not quite right, it's meant to use for Aplle Laser-writer.
There is a program set called Macps (in source code format, telnet to archie.unl.edu login as achie and search for macps will tell you which ftp site has it). One probably can convert it to compile on ST, I run it on AIX (RS6000) machine without problem. You will need to creat the header file first (there is doc. in the file set tells you how). Then everytime you want to send Mac's postscript file to printer just filter it through the macps first, which would change the necessary header to the correct one.

6918. v06INF1: Introduction to comp.sources.atari.st

Newsgroup: comp.sys.atari.st
Date: 1992-06-30 01:00:47 UTC
From: koreth@twitterpater.eng.sun.com
Message-ID: <l4vchvINNt3s@appserv.Eng.Sun.COM>
Source record: 220264
Cross-posted to: comp.sources.atari.st,comp.sys.atari.st

```
Submitted-by: koreth@twitterpater.eng.sun.com (Steven Grimm)
Posting-number: Volume 6, Info 1
Archive-name: intro

This is the first of two introductory articles about comp.sources.atari.st.
This one describes how to submit source to the newsgroup, where the
archive sites are, and how to contact them. The companion article lists
all previously-published sources.

I am always looking for suggestions on how to improve the usefulness
of the newsgroup, and can be contacted as listed below.

-- Steven Grimm
koreth@twitterpater.eng.sun.com

--------------------

Subject: Submitting source for publication

Items intended for posting or queries and problem notes should be sent to
atari-sources@twitterpater.eng.sun.com. If you are on a UUCP-only site, you
can send them to sun!twitterpater.eng!atari-sources.

If you want verification of arrival, so say in a cover note, or at the
beginning of your submission, if it is small. I try to verify that a
program works, and if I can't get it to work, I may hold up posting it
for a couple of days. Please note that, except in rare cases, source
without documentation will not be published. The backlog from receipt
to posting varies from one to four weeks depending mostly on the set
of submissions currently in my queue.

I prefer that you submit sources and binaries separately, as it's a
pain to separate them, and such submissions are invariably placed on
the back burner. Sources should be submitted in the same format as
binaries -- uuencoded arc, zoo, or lzh files. Please use Pierre Dumas'
"uue" program if possible, as it can correct some common transmission
errors. Split long submissions up into reasonable (less than 50K)
chunks. "uue" will do this for you, if you use "uue -700 file" to
encode.

Please inform me of any special system requirements, and what development
environment was used, so that I can properly test your submission and
label it when I post it.

--------------------

Subject: The structure of comp.sources.atari.st articles
```

Each posting in comp.sources.atari.st is called an "issue"; there are roughly 100 issues to a volume. The division is arbitrary and may vary. There are two types of articles in comp.sources.atari.st: sources and "information postings." They can be distinguished by the subject line:

Subject: v06INF2: Index for Volume 6 and other info

This first word in the title identifies this as the third info posting of volume one. Similarly, the subject line shown below:

Subject: v06i081: godsrc -- Universe simulator

identifies this as the 81st source article in Volume 6. Large sources are broken up into smaller pieces, and have subject lines that look like this:

Subject: v06i088: decbustr -- VMS clone in ST-LOGO, Part03/08

Certain information about the system configuration required to use the program is given on the keywords line.

Keywords: MWC, Megamax, 1meg, high

This means that the program compiles with Mark Williams or Megamax C, requires at least one meg of RAM and only runs in high resolution. Following is a list of keywords; new ones may be added as needed. They are mostly self-explanatory.

Alcyon - Alcyon C (included with Atari developer's kit)
MWC - Mark Williams C
Megamax - Megamax C
Laser - Laser C
Lattice - Lattice C
C - Any C compiler
OSS - OSS Personal Pascal
BASIC - ST BASIC (this is not a joke!)
uuencode - program is uuencoded (uudecode required to unpack)
arc - program is archived (arc required to unpack)
zoo-high - program is archived (Zoo 2.1 required to unpack)
lharc - program is archived (lharc required to unpack)
high - high resolution
medium - medium resolution
low - low resolution
1meg - needs 1 meg of RAM

The References: line, if present, points to the previous part of a multi-part program, so that newsreaders (trn, nn, etc.) which can follow threads will recognize a large program as a single thread.

The first few lines of an article are auxiliary headers that look like this:

Submitted-by: david@bdt.UUCP (David Beckmeyer)
Posting-number: Volume 6, Issue 80
Archive-name: micro-rtx

The "Submitted by" is the author of the program. If you have comments about the sources published in comp.sources.atari.st this is the person to contact. When possible, this address is in domain form, otherwise it is a UUCP bang path relative to some major (backbone) site.

The second line repeats the volume/issue information for the aide of notes sites and automatic archiving programs.

The Archive-name is the "official" name of this source in the archive. Large postings will have names that look like this:

Archive-name: desktop/part01

Please try to use this name when requesting that sources be mailed to you. Also, note that the "part number" given in the title, and the archive name given in the auxiliary header need not be identical.

Since most archive sites run UNIX, articles are given UNIX-style filenames rather than ST-style filenames. I do try to limit filenames to eight characters whenever possible, though.

Subject: Reporting and tracking bugs and patches to postings

Most of the time, bugs and updates will be posted to comp.sys.atari.st. Sometimes, "official" updates from the author will be posted submitted to comp.sources.atari.st so that they are archived with the sources.

Since there is no easy way to apply source code patches on the ST, changes to a program often result in a whole new version being posted.

To report bugs, contact the person listed in the Submitted-to header. Often there is a contact address in a README file, too. I do not maintain the sources I moderate, so don't send your bug reports to me.

Subject: Listing of archive sites in no particular order

1. Site twitterpater is running an archive server, which automatically answers mail requests. Send mail to archive-server@twitterpater.eng.sun.com with the word "help" in the message body for more information. Both the sources and binaries groups are archived on twitterpater.
2. Unido is the European archive site. It's running an archive server similar to twitterpater's; send "help" to unido!archive-server for more information. Unido archives both the sources and binaries groups.

If you know of additional sites which reliably archive comp.sources.atari.st (or comp.binaries.atari.st, for that matter), please tell me so I can add them to the list.

6919. v06INF2: Index of previously-published sources

Newsgroup: comp.sys.atari.st
Date: 1992-06-30 01:01:35 UTC
From: koreth@twitterpater.eng.sun.com
Message-ID: <l4vcjfINNt42@appserv.Eng.Sun.COM>

volume3/xxed11/part01 XXED editor, version 1.1
volume3/xxed11/part02
volume3/xbra XBRA trap-catching system
volume3/wd Uudecoding program (takes multiple file args)
volume3/gfa-uucode Uuencode/decode program in GFA BASIC
volume3/sozoinit Startup module for Sozobon C, for accs and prgs
volume3/fgrep GNU fgrep
volume3/belltest Test out NewBell bell sounds
volume3/chaos Draw random Sierpinski Triangles
volume3/bifurc Draw bifurcation diagrams
volume3/vbi Vertical blank interrupt handler (w/example)
volume3/sunclock Watch the sun go around a map of the Earth
volume3/norad/part01 Satellite tracker, version 2
volume3/norad/part02
volume3/st_conc Concentration game
volume3/mkrsc/part01 Resource construction program
volume3/mkrsc/part02
volume3/mkrsc/part03
volume3/mines Game of Mines for mono systems
volume3/showspec Show Spectrum .SPU pictures
volume3/switcher Pick random NeoDesk/DegaDesk pics, NewBell sounds
volume3/maze Walk through a maze in 3-D
volume3/nroff1.10/part01 Nroff clone, version 1.10
volume3/nroff1.10/part02
volume3/nroff1.10/part03
volume3/pi1tomon Display .PI1 pictures on a mono monitor
volume3/gulwrap Make Gulam work under Gemini
volume3/dublvis Format DS disks that work in SS drives
volume3/grep15/part01 GNU grep and fgrep, version 1.5
volume3/grep15/part02
volume3/grep15/part03
volume3/xmore Configurable "more" for various file types
volume3/mutate Disk sector editor
volume3/xxxx Insert numbers into files

volume3/sozo1.2pat Patches for Sozobon C 1.2
volume3/unx2st Convert ST <-> UNIX end-of-lines
volume3/mtprog1 Multitasking in Programming tutorial, posting 1
volume3/nroff110pat Patch for Nroff 1.10
volume3/lharc1.02/part01 Lharc source for ST and UNIX
volume3/lharc1.02/part02
volume3/lharc1.02/part03
volume3/cat2asc Convert STDCAT43 catalogs to pretty ASCII form
volume3/nroff110pat2 Patch 2 for nroff v. 1.10
volume3/nrchbar Generate change bars in n/troff documents
volume3/stturing Two-dimensional Turing machine
volume3/hdwboot Wait for hard disk to come online

Doesn't First Word itself have this feature? Something like turning of WP Mode or Save as ASCII. I'm sure it does because I've used it to edit my DESKTOP.INF file before. Can't say what the feature is for sure because I usually use WOrd Writer now, but check this out.

>Not kidding folks, not kidding.

I wouldn't mind giving out source, but I'd have to give you source to the entire sample playing subsystem of Game Workbench for it to do you any good. Needless to say, I'm not going to do that. (For one thing, it's 2515 lines of code.)

>Playing samples is very interesting, but soon ceases to amuse. Sampled
>sounds in programs, however...

You can get already get assembly sample-playing source from atari.archive; just look in atari/sound/players/resound.arc. The hardest part to get right is the "magic table," which is included in there.

Have a digitized day,

Hello once again!

I just recently downloaded AN Cool's M Demo 3, and would like to know if any other of this sort exist. This coder REALLY knows his music. I taped it just so I could listen to it in the car... :) I loved his Acid Burn demo as well (I have the one off of a.a.)

Do any other AN Cool demos or MOD files exist? How can I get in touch with this guy to convince him to release a CD? :)

l8r

Obiwan Kenobi

And he knows how to code too! geeeeeeeeeeeeeezzzzzzzz

Well it does, but you loose all the formating information, most WordProcessors (Atari ones that is) do have some sort of import option for 1st Word +...

Roger..... sheppard_r@kosmos.wcc.govt.nz

Before you do this you will have to E-Mail,

wmagro@roma.uiuc.edu (William Magro)

and ask him if this is correct, as he has posted here that all my messages are all incorrect...

This message will appear on all my postings from now on, untill that person retracts his false statments about me..??

Roger.....

When I sent the first version to the moderator it took so long to get through that I thought it wasn't going to appear. There may well be good reasons for the delays but an immediate release here gives people a chance to play around with it and if any problems arise I may get to fix them before the c.b.a.s version appears.

Oh dear, the bandwidth police are back. I shall plead guilty, but insane, and beg forgiveness from the net.

6931. Re: HiSoft Forth for the Atari ST

Newsgroup: comp.sys.atari.st
Date: 1992-06-30 07:43:15 UTC
From: lahtinen@gideon.fmi.fi
Message-ID: <lahtinen.709890195@gideon>
Source record: 220263
Cross-posted to: comp.lang.forth,comp.sys.atari.st

I have been using (also) HiSofth Forth and it is OK, there is quite good
support for Atari and the manual is good. But it is an unsupported product.
The developer does not work anymore with it (he does not work for HiSoft),
so there is not very much hope for a new version.

The only problem with it was the GEM-desktop. It does not support big screen,
only standard resolutions (ST). But there comes the source so it could
be changed if you like.

Personally I would suggest Bradley's Forthmacs. It is still supported and
you could buy it with ease as it is from California (they accept VISA).

HSC seems likke a real easy to use package, but it's delivered without the source-code, which I find quite annoying. Any luck that this will change at some point?

And what about gemfast? Will it ever become source-code accessible in a contemporary version? Since I have had strange bugs when trying to combine HSC libraries with sozobon 2.0 (disclaimer: I havne't investigated my troubles, it is a mere suspicion) I have searched for the source to gemfast in order to recompile it, but had no luck.

Sozobon (HSC or 2.0) is however getting there. I was very pleased to learn that I can compile the mint libraries and get something useable out in the other end. Makes life easier for us poor and miserable folks with a craving for C programs and just 1 lousy megabyte of storage.

6933. strftime() in gcc library---it works.

Newsgroup: comp.sys.atari.st
Date: 1992-06-30 08:21:21 UTC
From: neuhaus@vier.informatik.uni-kl.de
Message-ID: <neuhaus.709892481@vier>
Source record: 220281
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi.

I have recently posted an announcement for my port of ash, a
Bourne-compatibe shell from 4.4BSD, for MiNT. In my blurb, I
apparently said several things which may be easily misunderstood.

* strftime() isn't standard

That's not true, and I said so. I said that strftime() was ANSI, but
that the GNU date manpage mentioned several POSIX extensions. When I
wrote this, I had the relevant section of the ISO C Standard before
me, and either I'm blind, or there are really some formats featured by
POSIX, but not by ANSI. :-)

* strftime() can't be kicked out of the library

This can't really be true, because the only entry point that the
strftime() module defines is---strftime itself! The linker gave me
errors when I tried to compile GNU date, and I remember it choking on
strftime(). Must have been a weird setup, then.

* strftime() behaves illegitimately on undefined formats

This is not true, because the Standard itself says that the bahaviour
is undefined in such cases.

I would like to thank Michal Jaegermann for pointing out these errors
to me.

I have written 3 shareware CPXs:

PRNTSTYL - Sends user defined codes to your printer to set the style and font.
EVAL - Evaluate mathmatical expressions, with built it conversions.
LOCK - Locks the computer until the correct password is entered.

They are all much better than they sound when described in one line :-)
and should all be fully compatable with any ST. They all come with full
documentation.
If you are interested then email be with the subject line "CPXs" before the
end of the week and I will email you copies of each. They are not current
available elsewhere.

Message-ID: <H.fJD7ha1ds1c@wpcst1.phys-chemie.uni-wuerzburg.dbp.de>
Source record: 220289

Two weeks ago we have had a discussion about if WordPerfect would
upgrade the ST version to 5.1.

I phoned WordPerfect/Germany in Frankfurt and they _definitely_
declared that they will drop further developments on the ST platform.

Consequently, they offer switching to the DOS- or MAC-version at
reduced price when sending back the ST version.

As a result, I'm going to sell my version, asking for $60 (DM 90),
if anybody is (still) interested.

Thomas.

>Dave Johnson

Well..... if anyone REALLY wants to know about the Newton they can
read Byte. The most recent issue (subscription not newstand) has a bit
in there about it. Also, one of the mac magazines has info on it (more
than Byte actually - except Byte describes the ARM 610 used in the
Newton in more detail)

It's not a "true" notebook computer. It seems to be a combination
address book/DayTimer/notepad that is computerized, including
recognizing handwriting.

It's not a replacement for a "real" computer & is geared towards a
completely different market.

You got it! Turn word processing off by clicking on the "WP MODE" (under
the "Edit" menu, I believe) so that there is no mark next to it. Then
use "Save As" under the File menu and .... ASCII!

> HSC seems likke a real easy to use package, but it's delivered without the
> source-code, which I find quite annoying. Any luck that this will change at
> some point?

I think so. I can't speak for Ian, but he did include sources in the beta
copy that went out last week.

> And what about gemfast? Will it ever become source-code accessible in a
> contemporary version? Since I have had strange bugs when trying to combine HSC
> libraries with sozobon 2.0 (disclaimer: I havne't investigated my troubles, it
> is a mere suspicion) I have searched for the source to gemfast in order to
> recompile it, but had no luck.

I think this is very likely. But as I recall, the basic sources are mostly in
Atari's MadMac asm dialect, so you would need that assembler (from the
developer kit). There are C versions of most of the extensions, such as
the evnx_ library. I haven't had a chance to look at the new stuff yet,
so I'm not entirely sure what shape it's in.

6944. Accelerators and compatibility - Looking for advice

Newsgroup: comp.sys.atari.st
Date: 1992-06-30 15:26:20 UTC
From: djs@jet.uk
Message-ID: <1992Jun30.152620.3927@jet.uk>
Source record: 220313

I am looking for a processor upgrade for my STE to speed my programming work, but still need to be able to run 'timing sensitive' programs such as Steinberg Cubase.

Does anyone have experience using accelerators with Real Time programs? Are the 8MHz modes offered by some accelerators TOTALLY compatible with a standard machine (eg does an 8Mhz 68020 perform exactly as per a 8Mhz 68000, given that the program does not use priviledged intructions in user mode?)

Thanks for any advice

: Subject lines are really wonderful. I mean, what else is there to say?
:
: Ok, I could say that I'm ftp'ing from a.a to a VAX. I could then continue
: to say that its compress utility is unhappy with these damnable .Z's. And
: I could finish by saying that a tap on the infinite knowledge of the net
: would be most cool at this point in time..
:
: .Philip
:
: Just still without a .sig file, no matter how you look at it.

Some more precisions wanted !!

If you want to down-load to Atari (through VAX) just let it compressed
and use COMPRESS.TTP on your ST: it is easier to transport in compressed
form !
Else, I don't know much about compress on VAX !

Source record: 220288

One again I need to get in touch with DEREK? of Branch Always software.

Derek, I think we should talk about the possibility of my doing some beta-testing of your device here in the MicroConsultation Lab at The Ohio State University. I look forward to hearing from you on this.

I also have some basic questions about GEMulator and how it functions.

I assume it supports standard DOS hard drive partitions? That is, I guess I just setup an ATARI directory and a bunch of subdirectiories or something?

We would need to get GEMulator with roms, as I have no source in Columbus any longer.

That's right, Columbus recently lost our LAST Atari dealer :-(((((

6949. Background in MINT.CNF and symbolic links

Newsgroup: comp.sys.atari.st
Date: 1992-06-30 16:16:41 UTC
From: vince@sci.kun.nl
Message-ID: <1992Jun30.161641.9282@sci.kun.nl>
Source record: 220296

Recently there was a thread about the subjects mentioned, but as they were of no interest to me at the time, I skipped them. Of cause, as it's allways the case, I need the answers now.

How did you say you could run LPD in the background?

And about the links, I hoped I could lay links from all my execs all over my harddisk to /bin/usr. It didn't work. I can't mkdir on u: and after I link c:\bin\usr to u: it seems that I can add nothing to its contents since MiNT apparently tries to interpret the link in the process and thus put it on c:\bin\usr.

For example; I want c:\bin\usr\elvis.ttp to be accessible through u:/bin/usr/vi.ttp and .../ex.ttp, and d:\archiver\zoo.ttp as u:/bin/usr/zoo.ttp (and arc, and xlharc, etc...)

Any help appreciated.

BTW, are there any manpages about the MiNTutils? I have to just guess what all the options do after I manage to get a "usage:..." msg. What options can I give LPD?

Thanks,

Sander STOks

:EMILY:
Hints from Emily Postnews
==========

(Thanks to John Henders (jhenders@jonh.wimsey.bc.ca) for this bit of _humor_.)

Emily Postnews Visits comp.sys.atari.st

(Due to popular demand, (well at least one persone asked anyways), Emily has taken time out of her busy schedule to answer a few commonly asked questions specific to c.s.a.st.)

Dear Emily.
Some Amiga user is raving on c.s.a.st about how wonderful
his computer is, and how awful mine is. What should I do?
signed My Computer is NOT a Toy.

Dear My Computer, etc,etc.
Many people's egos are so tied to their possessions, they
have to affirm their existance by raving about the superiority
of their machine to anyone who will listen. You should immediately
flame these people into cinders, using every rumour or misconception
you've ever heard about their brand of computer, as this will cause
lots of posts, and develop into a massive flame war, which is one
of the main reasons most people read c.s.a.st. If this didn't happen
every six months, everybody would unsubscibe to this newsgroups from
boredom.
Or, you could put comp.sys.amiga.advocacy in the Followup to:
line, and any article replying to yours would go to the newsgroup
designed for this discussion.
Or, if your newsreader supports it, you could build a KILL FILE,
which eliminates any post that has the word Amiga in it.

Kill files can be created in rn and trn by hitting the 'K' key.
This will make a kill file based on the article you were reading
at the time. Then control K will put that file in the editor for you
to play with. You use the same regexp commands here that are in rn.
For example. /[Ff]oo/h:j would search all headers of unread articles
for both Foo and foo, and junk them. Check the docs for your newsreader
for further details.

Dear Emily.
I like flame wars, and want to start one of my own, so my name
will be as famous as Richard Covert's.
Signed, Too much Time on My Hands.

Dear Too much time.
Sorry it took so long to reply, but Richard's in my kill file
and someone had to forward your post to me, or I'd never have seen it.
Flame wars are fun. They're the main reason people creted Usenet,
and should be encouraged at every opertunity.
Some of the most common tricks for starting flame wars are as
follows.

1: Post a note in another newsgroup telling all the users there that they own a piece of junk, and if they had a half a brain, they'd have the same computer you do, as it's obviously the best.
2: Toss a bit of slander against another computer in a totally unrelated post. This guarantees a follow up, even if your original post wasn't of any interest.
3: Create a signature file that has a put down of another computer in it. This will get flame wars going in threads that have completely unrelated Subject: lines, thus slipping through all but he most exacting kill files.
I hope you find these tips handy in creating your next flame war.
And just remember, your computer MUST be the best, after all, it's yours.

:DEV:
How do I become a developer for the Atari ST?
==========

Contact Gail Bacani, Atari Rep Person, (408)745-2022

[UNITED STATES ONLY. IF YOU LIVE OUTSIDE THE UNITED STATES, CONTACT
YOUR COUNTRY'S ATARI HEADQUARTERS FOR MORE INFORMATION.]

Gail can explain the program to you, and send an information packet if you
desire.

Atari has gone to a 2-tier developer membership. The 'higher quality'
developer support goes to commercial developers, and costs $250. The
'no-hand-holding, no announcement of company future products, no access
to discounted hardware' goes to noncommercial developers, at an initial cost
of $125, plus $50 renewal fee each year.

Both tiers receive the ST/TT Developer Kit and all developers have to fill
in an application form and a non-disclosure agreement. Contact Gail for
more information.

Atari is now selling the developer's kit (or parts of it) seperately. No
project-in-development or non-disclosure agreement is necessary.

:ERR:
What does TOS ERROR nn mean?
What do the bombs on my screen mean?

==========

The information below was written, in part, by Darryl May, and posted on GEnie in January (of ????) by John Townsend. The original also appeared in the June 1988 issue of _Current Notes_ (122 N. Johnson Rd., Sterling, VA 22170). It has since found its way to me, and is being posted to comp.sys.atari.st as a service to readers.

Alan Pratt wrote to tell me that the basic information may be correct, but that it cannot be dubbed "official" unless it originates, on paper, from Atari. This makes sense, as electronic communications are easily modified, even accidentally.

Roland Waldi provided information regarding the difference between TOS and GEM return codes which appears to be correct. The tables have been modified to reflect his information.

The following is an unofficial list of the errors that can appear while you are operating your ST computer.

Error description return code alert box #
==========

OK (no error).....0
Fundamental error.....-1
Drive not ready.....-2
Unknown command.....-3
CRC error.....-4
Bad request.....-5
Seek error.....-6

What is Free-Net and how can I get access?
==

A "Remodeled" Atari S.I.G. Opens

By now many of you have heard of the Cleveland Freenet, or more
specifically the Atari S.I.G. on the Cleveland Freenet. For those who

haven't, the Cleveland Freenet is an experimental computer system providing free public community telecomputing. Basically, it's a lot like a public library of the future. Many of these systems are popping up all over the country. Don't be surprised if one pops up in your neighborhood in the future.

Recently the Atari SIG has undergone a significant face-lift. All the regular areas are intact including its news sections, user group newsletter, online magazine sections, general as well as specific computer discussion boards (8 bit, 16/32 bit, Lynx, Portfolio), and our weekly Sunday night multi-chat conference.

The conference starts at 8pm EST sharp and is on channel "+Ataricon". What the staff at the Atari SIG has added, has given the Atari SIG the potential to cover all grounds of Atari and its related products.

The most noticeable addition to the Atari SIG is the Programming and Development Forum. This forum is intended to be used by developers, professional programmers, and Atari hackers (the old definition of "hacker") as a means to share ideas, help each other out, and find out the latest technical information on Atari's products. This board is ran by newly acquired SIG Operator, Peter Haller, a professional programmer who is running developer sections on hardware and software development, programming, MIDI applications development, Graphics Design, plus many other sections that can definitely become a programmer and developer's dream come true!

Last, but definitely not least, the Atari SIG has a restructured Product Info and Support Board and a new Special Applications Board. The Support Board includes a vast library of support lists. These lists range anywhere from phone numbers of Atari dealers and producers, to software reviews for 8 bit, 16/32 bit, Lynx, and Portfolio software. To sum it all up this area covers what's out there, who makes it, and how to get it for all Atari products. The Special Applications Board is just starting out. Currently there is an area for users of MIDI on the ST. MIDI users are encouraged to use this as a means to discuss MIDI related topics. This section is expected to expand in the future.

Accessing the Atari SIG has never been easier. One can access it via Internet by telenet'ing to 129.22.8.75 or "Freenet-in-b.cwru.edu" or by calling (216) 368-3888 300/1200/2400 bps. Once on the system, a user can apply for an account application and logon as a visitor. Once here, simply type "Go Atari" to get to the Atari SIG. A visitor can go anywhere on the Freenet and can read anything. They can't post messages until they get their permanent accounts, however.

For additional information on obtaining access to Freenet write to myself via the e-mail addresses above or by writing the SIG at its US mail address:
The Atari SIG
P.O. Box 21815

Cleveland, OH 44121 USA

Lastly, a freenet application is available in the mail by writing a
request to the above address if you rather not download it from Freenet.

The Atari SIG is ready to serve the thousands of Atarians throughout
the world. We look forward to seeing you all real soon! Remember the
staff of the Atari SIG are volunteering their time for no pay and the
Cleveland Freenet, as well as the Atari S.I.G., is a non-profit organization
existing for the free exchange of information.

Atari Interface:

Write for a free sample copy of the Atari Interface magazine
(Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108)

AIM is soon to be available in Canada, Europe and Mexico, and should be in all local WaldenSoftware stores and many bookstores. If your "local" Atari dealer doesn't have it, he should be able to get it for you...

UK Mags:
(Thanks to Sam Marshall <samm@castle.edinburgh.ac.uk> for some info here.)

ST Applications:
---

formerly the ST Club Newsletter, this is now the only non-games mag in the UK (although see ST World below). Approx. 4,500 copies per issue sold. News, reviews, interviews, tech tips, general forum, programmers' forum, PD catalogue. DTP'd on an ST. Retains a 'user-driven' feel. Recommended. The associated ST Club runs a PD distribution service and distributes a couple of commercial programs too (Fontkit Plus, UIS III, Molgraph, CRL Virus Killer, etc.).

Subscription costs: UK - 15 pounds; Europe - 18 pounds (Air Mail); worldwide - 28 pounds (Air Mail)

Address: ST Club, 2 Broadway, Nottingham, NG7 1PS, UK.

ST World:
---

formerly the leading UK non-games mag. Became a quarterly 'buyer's guide' in Autumn 90. Now, allegedly, about to be revived as a monthly (under the stewardship of Jean Gollner, mother of ex-editor Hugh) in the wake of Atari UK's new push into the 'serious' market.

ST Format:
---

all-purpose 150-page monthly, mainly aimed at young people. Lively, but of uneven quality. Big leisure section, but other areas covered too. Includes cover disk - mix of games demos and (usually out of date) PD utilities. Probably the biggest-selling UK ST mag. Has had several public rows with Atari UK.

Atari ST User:
---

like ST Format. Generally (amongst online users) thought to be not quite as good.

ST Action:
---

games, games and more games. And games.

Atari ST Review:

Lots of info, more mature editorial style than Format, but not so polished. 2 cover disks per issue.

There are ST sections in New Computer Express (weekly) (this magazine ceased publication in February 1992), Computer Shopper (monthly) and some general-purpose games mags whose names I forget.

There are also, I think, some MIDI mags with strong ST content. I don't have their names.

German Mags:

Atari PD Journal:

Reviewed in the May '91 issue of Current Notes [from which I'm cribbing this information, DP-Z]. Hardware and Software reviews, some commercial software reviewed. Typical issue runs around 90 pages. Special "Katalog" section.

Subscription: DM 70 (normal mail), DM 100 (air mail). Prices may be for domestic distribution -- write first!

Address: Heim Verlag, PD Abonnement, Heidleberger Landstrasse 194, 6100 Darmstadt 13 GERMANY

ST-Magazin (formerly 68000er):

(monthly) Typical issue: around 150 pages. Includes DTP-magazine CICERO.

Subscription: DM 77 (domestic distribution); foreign - write for information

Address: ST-Magazin, Markt & Technik Verlag AG, Hans-Pinsel-Strasse 2, D-8013 Haar bei Muenchen GERMANY

ST Computer:
---

11 issues/year, typical around 180 pages

Subscription: DM 80 (domestic), DM 100 (normal mail), DM 130 (air mail)

Address: Heim Verlag, Heidelberger Landstr. 194, D-6100 Darmstadt 13 GERMANY

:TIPS:
TIPS AND HINTS from other users
==========

Any 'multisync' monitor which handles 70 video fields a second can be used with the ST; the custom cable involves no tricks, or commercial ones are available. The original NEC multisync does NOT handle 70 fields a sec.

More than 3 bombs often means more than 1 error, so interpretations are tricky.

An ST-formatted disk which is not readable by a PC can be made readable by putting the 3 bytes EB 34 90 (those were 3 bytes of hex) at the beginning of the boot sector (sector 1 of track 0, I believe). This can be done with either an ST or PC absolute sector editor. The Desktop of TOS 1.4 and higher does this automatically. Note that the only format of disk that will

work between both the PC and ST is 9 sectors, 80 tracks.

Some (older) PC-3.5"-drives cannot deal with the short track-header produced by ST formatters. On those drives, ST-formatted disks are not readable, independent of their boot sector contents. The other way, however, does always work: format on the PC.

When using disks formatted on a PC in an ST, make sure to insert and access a disk with a different serial number in between disk changes.

For those with the 'inaccessible' mouse and joystick ports, a joystick extender cable will make life easier. The Y-cable joystick extenders make it extremely easy to keep mouse and joystick connected to port 0, and a joystick extender cable in port 1 makes for easy hookup after you've moved the machine.

BARREL is a program which can redirect printer-data to a file. It comes in handy when your printer is unavailable, and the program does not already have an option to 'print-to-a-file'. (It is available on the atari.archive server.)

DBLEFEAT is a program which can redirect disk access from, say, drive A to drive B. Handy when a program 'hard-codes' the data drive, and you wish to use your hard drive instead. (It is available on the atari.archive server.)

On the Desktop of TOS 1.4 or higher, holding the right mouse button allows you to manipulate files in other windows. This is useful for a number of reasons. An example is this: say D:\BLAH.ARC is a file you would like to extract to D:\, but ARC.TTP is on C:\. Top D:\'s window, then hold the right button while double-clicking ARC.TTP in an inactive window.

:ZNET:
Where can I get copies of ZNET?
==========

ZNET is now Atari Explorer Online. Please see EXPLOR for more info.

:EXPLOR:
Where can I get copies of Atari Explorer Online?
==========
Atari Explorer Online magazine is available on CompuServe and GEnie. You can also get copies mailed to you by sending an e-mail message to

stzmagazine-request@virginia.edu

indicating you wish to subscribe.

They won't get to you on Friday (which is when they're posted), but Greg Lindahl provides an excellent service to the networking community by sending these out.

Atari Explorer Online and some information from the Current Notes user magazine are also available from the atari.archive server under

/atari/magazines.

:PD:
Where can I get Public Domain/Shareware software?
==========

There are FTP sources and a comp.sources.atari.st/comp.binaries.atari.st
mail server. You can also try the commercial on-line services such as
GEnie, CompuServe, Delphi and Bix.

Using FTP, most files should be retrieved in BINARY format (at least those
ending with the suffix of .ARC, .LZH, .ZOO, .PRG, .TTP, .TOS)

Mail servers encode files. You will need a program called 'uudecode' in
order to change files ending with the suffix .UUE (or .UAB, .UAC, etc.)
into their original form.

:MAIL:
E-Mail file servers

archive-server@twitterpater.Eng.Sun.COM:

Twitterpater holds all of the comp.sources.atari.st / comp.binaries.atari.st
postings. If you aren't reading these two newsgroups, you should consider
doing so. You may obtain uuencoded files as e-mail. You can obtain a
help file by mailing a message to archive-server@twitterpater.eng.sun.com, with
the main body of the message being the word 'help'.

atari@atari.archive.umich.edu:

The atari.archive server is mentioned many times in this article. It contains
a multitude of Atari ST PD and shareware programs. If you don't have access
via FTP you can obtain many of the files via e-mail. You should first obtain a
help file by mailing a message to atari@atari.archive.umich.edu, with the main
body of the message being the word 'help.'. If you are from a uucp site,
please enclose this statement also 'path host1!host2!....', where
host1!host2!... is your path. Please read the help file completely before you
ask questions, and then send any you may have to jon@atari.archive.umich.edu.
Any questions about the archive or specific files go to
weiner@atari.archive.umich.edu

archive-server@lancs.pdsoft:

This is a UK public domain archive, available to sites within the UK via
via JANET.

info-server@ftp.Informatik.Uni-dortmund.DE:

This is a german public domain archive.

mail-server@cs.ruu.nl (or uunet!mcsun!hp4nl!ruuinf!mail-server):
----
send the following message

begin
path john@highbrow.edu (PLEASE SUBSTITUTE *YOUR* ADDRESS)
send ATARI-ST/index
end

NOTE: *** PLEASE USE VALID INTERNET ADDRESSES IF POSSIBLE. DO NOT USE
ADDRESSES WITH ! and @ MIXED !!!! BITNETTERS USE USER@HOST.BITNET ***

The path command can be deleted if we receive a valid from address in your
message. If this is the first time you use our mail server, we suggest you
first issue the request:
send HELP

LISTSERV@UOGUELPH.BITNET:

Mail messages with the contents HELP will bring you some usage information
and GET PROG-A16 FILELIST will provide you with a list of files. Subscriptions
to INFO-A16 are also available on this server. INFO-A16 is a digest of
messages from comp.sys.atari.st.

:FTP:
Anonymous FTP servers

Note: The generally accepted practice for FTP use is as follows:

1. Limit access times to non-working hours. This is usually 6-8 pm
to 8-9 am LOCAL time. LOCAL time means local to the computer
you are accessing! For example, 4 P.M. in Minneapolis, Minnesota
is 10 P.M. in England, and 10 A.M. in Germany is 4 A.M. in New
York.

2. Once you connect, issue the following commands at your FTP
prompt:

user anonymous
<YOUR e-mail address should be entered at the Password: prompt)
ls
cd <to the appropriate directory>

3. Limit downloads, especially across the ocean. Remember, there are
other people who are using the same lines as you.

Atari FTP sites (the list is -not- exhaustive)
----

atari.archive.umich.edu [141.211.164.8]

uk.ac.lancs.pdsoft (available to UK users via JANET)

Note: Access is a bit different for this archive site, use the following:

user pdsoft
pdsoft (at the Password prompt)

ftp.Informatik.Uni-dortmund.DE [129.217.64.63]

cs.uni-sb.de [134.96.7.254]

archive.cs.ruu.nl [131.211.80.5]

TEX Is TeX/LaTeX available on the Atari ST?

:WEL:
Welcome to comp.sys.atari.st
============================

This newsgroup is devoted to discussion about 16 and 32 bit Atari micros. At
present that includes the Atari 520ST, 1040ST, Mega ST, STe, STacy, Mega STe,
and the Atari TT. There are also emulators for the Apple Macintosh and IBM
PC/XT/AT available.

Most of the people who read this newsgroup are technically oriented.
The newsgroup serves as a resource for Atari users ... feel free to
contribute to the discussions.

Associated newsgroups include:

comp.binaries.atari.st ! uuencoded binary programs
comp.sys.atari.st.tech ! technical programming/hardware topics

comp.sources.atari.st ! uuencoded/shar sources

:ARCS:
How do I deal with Archived files (.ZOO, .ARC, .LZH)?
==========

Files ending with suffixes .ZOO, .ARC and .LZH are archive files. They are
binary files which may contain one or more other files in a compressed format.
Archive files usually take up less disk space, and for this reason have
become quite popular for transferring large files via modem.

In order to extract the files from an archive file, one must use an archive
program. Here are the correspondences:

ARC Use ARC.TTP
LZH Use LHARC.TTP
ZOO Use ZOO.TTP

ARCHIVERS
These programs are all available via FTP from the atari.archive server, in the
/atari/archivers directory. Recommended files are:

arc602.ttp - version 6.02 of ARC, includes features to archive
subdirectories and also include comments with files.

arc602.arc - contains documentation. UnArc using arc602.ttp.

arc521e.arc - older version of ARC. Used mostly by those who want
speed, better compression, and don't care about
archiving subdirectories. UnArc using arc602.ttp.

lharc.ttp - version 2.0 of LHARC.

lzh201i.lzh - Thomas Questors lzh utility. German documentation.
UnArc using lharc.ttp

zoo21.ttp - version 2.1 of ZOO

zoo21bin.zoo - ZOO archive includes documentation. UnArc using
zoo21.ttp.

:CLI:
What Command Line Interpreters are available?
==========

There are a large number of Command Line Interpreters for the Atari ST.
Some of the more popular ones include:

gulam the 'classic' cli, somewhat UNIX in flavor

BASH GNU Bourne Again Shell - available under MINT

ksh Korn Shell - available under MINT

gemini MUPFEL is the shell used by the gemini environment

okami a German shell with many useful utilities built in

pcommand an MS-DOS-like shell

csh C-shell, standard on Unix

tcsh Enchanced C-shell - available under MiNT

Check atari.archive under /atari/cli or /atari/mint, or check one of the other FTP sites for files.

:ERR:
What does TOS ERROR nn mean?
What do the bombs on my screen mean?
==========

The information below was written, in part, by Darryl May, and posted on GEnie in January (of ????) by John Townsend. The original also appeared in the June 1988 issue of _Current Notes_ (122 N. Johnson Rd., Sterling, VA 22170). It has since found its way to me, and is being posted to comp.sys.atari.st as a service to readers.

Alan Pratt wrote to tell me that the basic information may be correct, but that it cannot be dubbed "official" unless it originates, on paper, from Atari. This makes sense, as electronic communications are easily modified, even accidentally.

Roland Waldi provided information regarding the difference between TOS and GEM return codes which appears to be correct. The tables have been modified to reflect his information.

The following is an unofficial list of the errors that can appear while you are operating your ST computer.

Error description return code alert box #
==========
OK (no error).....0
Fundamental error.....-1
Drive not ready.....-2
Unknown command.....-3
CRC error.....-4
Bad request.....-5
Seek error.....-6
Unknown media.....-7
Sector not found.....-8
No paper.....-9
Write fault.....-10
Read fault.....-11
General error.....-12
Write protect.....-13
Media change.....-14
Unknown device.....-15
Bad sectors on format.....-16
Insert other disk.....-17

```
Invalid function number.........-32.............1
File not found..................-33.............2
Path not found..................-34.............3
No handles left.................-35.............4
Access denied...................-36.............5
Invalid handle..................-37.............6
Insufficient memory.............-39.............8
Invalid memory block address...-40.............9
Invalid drive specified.........-46............15

No more files...................-49............18
Range error.....................-64............33
Internal error..................-65............34
Invalid program load format....-66............35

The last code is the infamous "TOS error 35"!

Also, some unofficial information via Alan Pratt:

Notably, you should add -48: ENSAME (not the same drive, occurs when
you call Frename and the two names you give aren't on the same drive),
and -67: EGSBF: you can't use Mshrink to GROW a block of memory.

Those bombs that appear on your screen are error messages from
the 68000 micro-processor.

Number
Description of bombs

```

Level 7 Interrupt Autovector....31
Trap Instruction Vectors.....32-47
[unassigned, reserved].......48-63
User Interrupt Vectors......64-255

:GDOS:
What is GDOS, and where can I get it?
====================================

GDOS stands for Graphic Device Output System (at least that's what my copy of STart, volume 1 number 1 said...)

There is a newer version, called FSMGDOS, which should be available commercially from Atari. It is currently included with WordFlair II. FSMGDOS uses scaleable fonts - you do not need to create a font file for every point size. Current word is that the street price for FSMGDOS will be about $50. The Lucida font family comes with FSMGDOS, and the output is very nice, even on a 9-pin Epson printer. There are desk accessories which allow you to manipulate available fonts, and also CPX programs for the newer Atari Control Panel. For those who only have limited memory, a newer version of GDOS is also included with the distribution. For those with investments in older bit-mapped GDOS fonts, they may be used with the new version of GDOS or used as bit-mapped (ie. non-scaleable) fonts within FSMGDOS.

You can get a copy of "Everything You Ever Wanted to Know About GDOS (and more)" by Douglas N. Wheeler from the atari.archive server. The file is /atari/programming/gdos.arc.

There is a German version of GDOS available from the atari.archive server. The file is /atari/utilities/amcgdos.arc.

Currently, there are no truly public domain sources for the GDOS system files or font files (at least those supplied by Atari). You can get these files with many commercial programs, such as Degas Elite, WordFlair, etc. You might also want to check your local user group to see if they received a copy of the WordFlair demo program (also available on GEnie). The demo program appears to have the GDOS system and font files.

:GNU:
What GNU software is available for the ST?
===

The Free Software Foundation C compiler, commonly known as GNU C (or gcc) is avaiable for the Atari ST. The minimal memory required to do any useful (i.e. beyond 'hello world') programming is 2.5 megabytes. A 4 megabyte system is recommended.

There is an extensive archive of the latest GNU C programs via anonymous FTP on atari.archive. GNU C is also available at cs.uni-sb.de and most other European FTP sites. The latest version of GCC available for the ST is 2.1, this version includes built-in support for C++.

The following can be found in the /atari/gnustuff/tos directory of
atari.archive: (Note: all of these have Unixmode and MiNT support)

BASH Bourne-again shell
BISON Yet another YACC (Yet Another Compiler Compiler)
COMPRESS Compatible with Unix compress
DIFF Compares files; PATCH does the inverse
EMACS Extreme editor :-)
Fileutils Unix file utilities
FLEX Lexical analyzer, like Unix lex
GAWK AWK report generation language
GCC 2.1 C, C++ compiler
GDB GNU debugger, with source level C support
Ghostscript Postscript clone
GROFF Text formatting system
GREP Regular expression search, like Unix grep
MAKE Like Unix make
MAKEINFO Stand-alone system to process .info files
PATCH Changes files from diffs; DIFF does the inverse
PROF Profiles executable code
RCS Revision Control System
SED Stream editor
Smalltalk Smalltalk; object oriented language
TAR Tape archiver like Unix tar

:HAM:
Where can I find Ham Radio software for the ST?
==========

Plenty of Ham Radio software is available for the Atari ST:

Morse code
Radio Teletype (RTTY)
Packet Radio (W0RLI BBS and K9AQ TCP/IP)
Satellite Tracking
WEFAX
Color Slow Scan TV (SSTV)
etc.

For more information contact the Atari Microcomputer Network:

Newsletter Editor - Gil Frederick, VE4AG
130 Maureen Street
Winnipeg, Manitoba
R3K 1M2 Canada
or
Program Librarian - John Adams, KC5FW
17106 Happy Hollow
San Antonio, TX 78232
U.S.A.
or
Tune into the weekly net Sundays 16:00 UTC on 14.325 MHz.

73,
John Langner, WB2OSZ

:LANG:
Public Domain/Shareware languages...
==========

There are a large number of programming languages available for use with the Atari ST. Programmers seem to flock to the Atari ST, and if you know of a language, you can probably find it, or an equivalent, for the ST.

68000 assembler/disassembler
abc
APL
AWK
BASIC
C
C++
cross assemblers (z80, 6502, 68xx,8031/80xx)
Elan
FORTRAN
FORTH
ICON
LISP
Modula2
OPS5
perl
PROLOG
SCHEME
Smalltalk
XLisp
XProlog
XScheme

Check the atari.archive server under /atari/languages. Most other archive sites will have a language directory which you can also check.

:MINIX:
Is MINIX available on the Atari ST?
==========

MINIX is a UNIX-like operating system for the IBM PC, XT, AT, 386, and PS/2, as well as the Apple Macintosh, Commodore Amiga, Atari ST, and later in 1991, Sun SPARC. It is available with all the source code for the entire operating system, the libraries, and nearly 200 UNIX-like utilities.

Demonstration disks for the IBM PC line and Atari ST are available for free via anonymous FTP for people on the Internet. A Macintosh version will be online soon. (If you can't wait, see below.)

To get a free demo disk and the manual, use ftp to connect to ftp.cs.vu.nl (192.31.231.42) and look in pub/minix/demo. The READ_ME file describes the contents of the directory and how to use it. Be sure to

fetch and read this first. It contains important information.

If you don't have FTP access, you can buy the demo disk package from Prentice-Hall for $10 by calling (201) 767-5969 or FAX (201) 767-5625. Please DON'T ask me to send it by email. I have quite enough work already thank you. The ordering numbers for Prentice-Hall are:

- MINIX 1.5 IBM demo disk (0-13-582768-x) (in stock now)
- MINIX 1.5 Atari demo disk (0-13-582792-2) (in stock now)
- MINIX 1.5 Macintosh demo disk (0-13-582784-1) (in stock now)

Please note that although the demo disks are available for free on line, MINIX itself is copyrighted software and is not available on line. The demo disks are also copyrighted, but permission is hereby granted to upload and use them for evaluation purposes. The READ_ME file tells how MINIX can be ordered.

AS A COURTESY TO US, PLEASE DO NOT FTP DURING BUSINESS HOURS (EUROPEAN TIME). PLEASE FTP AFTER 11 A.M. EASTERN STANDARD TIME.
If you want to follow the MINIX discussion, read the comp.os.minix newsgroup, which is quite active and has almost 50,000 subscribers.

Have fun!

Andy Tanenbaum (ast@cs.vu.nl)

:MINT:
What is MiNT?
=============
MiNT is a free multitasking operating system extension for TOS. It is somewhat like BSD Unix from the programmer's perspective. MiNT can run up to 1 GEM program along with a lot of character-based programs simultaneously. MGR and MW2 can both put multiple terminal windows on screen, and bgacc can put a number of terminal windows on a GEM screen. MiNT and lots of stuff to go with it can be found at atari.archive.umich.edu:/atari/mint.

A somewhat interesting note: MiNT is now the kernel of Atari's multitasking OS, MultiTOS. Originially MiNT stood for 'MiNT is Not TOS', but it's now 'MiNT is Now TOS'. :-)

:DEMOS:
Why won't demo x run on my machine?
===================================

90% of the time, if a demo does not run on your American ST, you probably need to be in 50Hz mode to use it. Get a program like 50hzboot.prg from atari.archive to allow this.

:PAINT:
What is the format for [x] paint program data?
==

There is a periodic posting of ST Picture Formats, edited by David Baggett. The file is on the atari.archive server under /atari/graphics/picfmts.doc.

:PD:
Where can I get Public Domain/Shareware software?
==========

There are FTP sources and a comp.sources.atari.st/comp.binaries.atari.st
mail server. You can also try the commercial on-line services such as
GEnie, CompuServe, Delphi and Bix.

Using FTP, most files should be retrieved in BINARY format (at least those
ending with the suffix of .ARC, .LZH, .ZOO, .PRG, .TTP, .TOS)

Mail servers encode files. You will need a program called 'uudecode' in
order to change files ending with the suffix .UUE (or .UAB, .UAC, etc.)
into their original form.

archive-server@lancs.pdsoft:

This is a UK public domain archive, available to sites within the UK via
via JANET.

info-server@ftp.Informatik.Uni-dortmund.DE:

This is a german public domain archive.

mail-server@cs.ruu.nl (or uunet!mcsun!hp4nl!ruuinf!mail-server):
---
send the following message

```
begin
path john@highbrow.edu (PLEASE SUBSTITUTE *YOUR* ADDRESS)
send ATARI-ST/index
end
```

NOTE: *** PLEASE USE VALID INTERNET ADDRESSES IF POSSIBLE. DO NOT USE ADDRESSES WITH ! and @ MIXED !!!! BITNETTERS USE USER@HOST.BITNET ***

The path command can be deleted if we receive a valid from address in your message. If this is the first time you use our mail server, we suggest you first issue the request:

```
send HELP
```

LISTSERV@UOGUELPH.BITNET:

Mail messages with the contents HELP will bring you some usage information and GET PROG-A16 FILELIST will provide you with a list of files. Subscriptions to INFO-A16 are also available on this server. INFO-A16 is a digest of messages from comp.sys.atari.st.

:FTP:
Anonymous FTP servers

Note: The generally accepted practice for FTP use is as follows:

1. Limit access times to non-working hours. This is usually 6-8 pm to 8-9 am LOCAL time. LOCAL time means local to the computer you are accessing! For example, 4 P.M. in Minneapolis, Minnesota is 10 P.M. in England, and 10 A.M. in Germany is 4 A.M. in New York.

2. Once you connect, issue the following commands at your FTP prompt:

```
user anonymous
<YOUR e-mail address should be entered at the Password: prompt)
ls
cd <to the appropriate directory>
```

3. Limit downloads, especially across the ocean. Remember, there are other people who are using the same lines as you.

Atari FTP sites (the list is -not- exhaustive)
---

atari.archive.umich.edu [141.211.164.8]

uk.ac.lancs.pdsoft (available to UK users via JANET)

Note: Access is a bit different for this archive site, use the following:

```
user pdsoft
pdsoft (at the Password prompt)
```

ftp.Informatik.Uni-dortmund.DE [129.217.64.63]

cs.uni-sb.de [134.96.7.254]

archive.cs.ruu.nl [131.211.80.5]

:TEX:
Is TeX/LaTeX available on the Atari ST?
=======================================

The TeX/LaTeX typesetting programs are available on the Atari ST. Check the
atari.archive server under /atari/tex. Fonts and device drivers
(including one for the Epson 9-pin printers) are available on the
atari.archive server.

The latest version of TeX (3.1) has recently been made available on the
atari.archive server. The files are in a subdirectory of their own.

Graham Higgins recently wrote a message in comp.sys.atari.st indicating the
minimum files needed to get a working TeX/LaTeX system up and running on the
Atari ST. He said:

You'll need, at minimum:

The binaries for LaTeX/TeX :StTeXBin
The style files :StTeXSty
The font macros :StTeXTfm

If you want to screen-preview, you'll need screen font files (showdvi)
If you want to print locally, you'll need printer font files (dvifont)

Allow 5Mb.

For a step-by-step article on setting up Tex and LaTeX, send an e-mail request
to davidli@simvax.labmed.umn.edu. Be sure to mention 'tex.setup'.

There is also a complete, ready-to-install distribution called CS-TeX. The
latest version, 4.0, is available at atari.archive: /atari/tex/cs-tex-4.0.
This consists of 8 disks full of TeX stuff, plus an installation program
that takes care of the details for you.

==
Hope you liked the comp.sys.atari.st FAQ. If you have comments,
suggestions, more material, etc., mail me at sourada@iastate.edu

Thanks to David Paschall-Zimbel (davidli@simvax.labmed.umn.edu) for
compiling most of this FAQ.

Welcome to comp.sys.atari.st
============================

This newsgroup is devoted to discussion about 16 and 32 bit Atari micros. At
present that includes the Atari 520ST, 1040ST, Mega ST, STe, STacy, Mega STe,
and the Atari TT. There are also emulators for the Apple Macintosh and IBM
PC/XT/AT available.

Most of the people who read this newsgroup are technically oriented.
The newsgroup serves as a resource for Atari users ... feel free to
contribute to the discussions.

Associated newsgroups include:

comp.binaries.atari.st ! uuencoded binary programs
comp.sys.atari.st.tech ! technical programming/hardware topics
comp.sources.atari.st ! uuencoded/shar sources

:ACCEL:

(Thanks to Shoou-yu Tang sytang@lamar.colostate.edu for this info.)

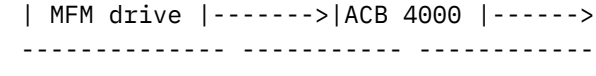
68000 based: ICD adspeed ST/STe
Fast Tech Turbo T-16 (16MHz)
T-20 (20MHz)
T-25 (25MHz)
68030 based: Gadget by Small SST (16MHz to 40MHz user changeable, 8 SIMM slot
68882 FPU socket, 1 expansion slot, TOS 2.0x).
Fast Tech : Tiny Turbo
Full size version

:DRIVES:
What should I know about hard drives and the ST?
(Thanks to Shoou-yu Tang sytang@lamar.colostate.edu for this info.)

To get a hard drive for ST, STe, Mega, Mega STe or TT(using DMA port):
1. Host adapter (convert the ST's DMA to SCSI standard):
ICD, Supra, BMS are the three major manufature. ICD has very good
software updating support and updates very often.
2. SCSI hard drive or MFM/RLL drive with SCSI adapter:
i). SCSI drive:
Like Quantum Pro80LPS, Seagate ST-xxxN series, they have a 50 pins IDC
connector, and usually say SCSI hard drive or Mac drive. (Any Mac except
Mac128, Mac512, FatMac has SCSI built in, so a drive that works with Mac
usually has SCSI interface).
No other adapter needed, just connect to the host adapter in 1.

ii). MFM/RLL drive:
These types of drive is older and used in older IBM machines. To use
them you need an adapter to convert them to SCSI. Adaptec 4000/4000A
is for MFM, 4070 for RLL drive, Emulex and OMTI also has similar cards
availible. Adaptec has stopped production for quite sometime so look for
these in used/liquidation place. (usually goes $40 to $75 each).

Connect the drive to the adapter (said Adaptec 4000) then connect the
adapter to the host adapter. (said ICD). It looks like following:



3. Case, power supply and cabels for the drive system:
Unless you have Mega, Mega STe, TT and the drive is 3.5" so you will put
the drive internally, you will need a case with power supply to house the
adapter and hard drive. IBM case is very easy to get and has a lot of space
for expansion.
For older drive you need about 40 watts each drive, for newer 3.5" drive
they use about 20 watts or less, Quantum LPS drive use about 10 watts each,
make sure your power supply has more than the drives need. Again if you
use IBM case, the 150 watts power supply for that type case can drive at
least 3 drives without problwm.
Cables: DMA cable usually comes with the host adapter.
power cable from power supply to drive usually comes with power sup

SCSI cable from host adapter to SCSI drive or adapter(for MFM/RLL),
it's 50pins IDC female connector on each end with 50 conductors
cable. Should be availible at place you get the drive.
For MFM/RLL drive you will need the usual MFM/RLL drive cable:
(a 34 conductors cable and a 20pins connector, again should be
available at the place you get the drive).

Now, connect them all together. Before power up, check the connection again. And check the jumper setting on the drive (consult the drive's manual). If you are using more than one drive with the system, make sure only the last drive has the terminator (either a DIP or a signle inline package of resistor, which usually is socketed and close to the SCSI connector on the drive circle board. Remove the terminator from other drives. [only the last drive should have the terminator]

Software usually comes with the host adapter, or you can FTP atari's AHDX5 from ftp sites.

:FLOPPY:
Can I use 1.44 meg floppy disks?

1.4 megabyte floppy drives will soon be available from Atari for MegaSTe and TT machines. If you own an older Atari ST, there is a company which offers a $199 kit (including floppy) to install and use the drive. (I will supply the name next month, sorry...)

Note that Tos versions prior to 2.05 will not format a 1.4 meg floppy from the desktop.

:GRAPHIC:
How can I enjoy enhanced graphics on my ST?

For stock STs, JRI makes a chip which allows a 4096 color palette.
There is also a public domain enhancement that allows 32768 colors on
older STs. This can be found as 32kcolor.lzh on some archives.

There are a number of graphics boards on the market. Here is a first pass at listing some of them. The information is based on postings by Ben Gilbert and Jari Lehto.

C32 board by Matrix Datensystem (Germany)
* 800x608, 256 colors
* all ST/TT models
* 256k, 512k and 1meg versions

C75Z board by Matrix Datensystem (Germany)
* 1024x768, 256 colors
* Mega ST or STe, TT VME Buss

(Matrix GmbH has over 15, maybe over 20 with all versions, different graphics boards available, from hobbyist to professional, from CAD to GenLock and digitizing.)

ISAC board by Dover Research Company (U.S.)
* 1024x768, 16 colors from palette of 4096
* makes hi-res look like ST low res, just with a huge window
* Mega ST buss
* Dover Research Co. (612) 492-3913

The Imagine by Wittich Computer GmbH (Germany)
* 1024x768, 256 colors
* Mega ST only

(Versions available for all ST/TT models. Several possible resolutions.
Reasonable price, but slow and not very compatible..)

Crazy Dots by TKR (Germany)
* 1024x768, 256 colors
* Mega ST only

(1280x800, 256 colors out of 16.7 million color palette. 1664x1200 for
both 16 color and monochrome. True color option available. Mega ST,
Mega STe and TT.)

reSOLUTION SuperVGA by GengTec (Germany)
* 8 resolutions, 320x200 through 1600x1200
* 16 colors without driver, 256 out of 256,000 with driver
* 1 mb RAM
* uses a standard VGA monitor
* Mega ST or regular ST
* available in U.S. from Rio Datel, 1-800-782-9110, (702) 454-700

(1024x768 is the highest resolution with 256 colors. Driver is called
Multicolor VGA option. Compatible with NVDI and Blitter. Multisync
monitor recommended.)

AlberTT
* like ISAC card, but specific for TT VME buss

MegaScreen
* 832x624 monochrome
* connects to MegaBus
* works with Spectre

Reflex
*1024x1024 with SM124 monitor
*2048x2048 possible with expansion
*usable with most big-screen displays

ODIN by Marvin AG (Switzerland)
* external expansion
* gives TT-resolutions to a regular ST

Cyrel
* RISC-based card
* extremely costly

Graphics cards for which information is sought:

OmniChrome board by Omnimon Peripherals

JRI GenLock

Atari/Lexicor 24 bit color card

Jari Lehto proposed the following recommendations:

Low budget SVGA - reSOLUTION
Professional high-end use Cyrel (or is it Cyrix?)
Hobby or semi-pro DTP Reflex
Hobby DTP MegaScreen
To obtain TT resolution ODIN

:JOY:
What joysticks work best with the Atari ST?

The Atari ST works with joysticks with a 'standard' D-Socket. IBM-style joysticks, Apple joysticks, and Nintendo joysticks will -not- work.

Some recommended joysticks:

Konix Navigator - "best .. if you want to use it for any length of time"
Gravis - "responsive ... great for games like MidiMaze"
WICO - "strong reed switches, hard plastic and metal components"
Atari - "FAR more controllable and responsive than other, more durable units"

:MODEM:
What modems work with the Atari ST?

Any external modem should work fine with the Atari ST-series of computers. You will need to purchase or build an RS-232 cable. Be sure the cable is capable of establishing DTR with your modem, as many telecommunications packages check the status of the DTR line. (Ask your local hardware guru if you don't know what DTR is...)

The ST can connect to modems at up to 19,200 baud. Practically, you will purchase either a 2400-baud or 9600-baud modem. The cost of 2400-baud modems has dropped so much in the past few years that you should not even consider a slower modem. Believe me, modem speeds under 2400-baud are going to seem SLOOOOOOOW to you!

:MONITOR:
What should I know about monitors and the ST?

The monitor is your connection to the ST. Without a monitor, you're typing blind. (Unless, of course, you have an RF modulator on your ST and attach it to your TV set. This is discouraged, as the bandwidth and resolution are pretty terrible for anything other than arcade games.)

There are three monitor choices for those of us owning Atari ST/STe equipment:

1. Monochrome monitors - these include the venerable SM124, one of the sharpest monochrome monitors on the market. Street price is about $150,

used monitors should run around $80-90. You can also purchase a 19" monochrome monitor. This gives you a 'big screen' to play around in, and is best for work with DTP and CAD systems. The price is a bit high at $1500+, and you'll need a plug-in board, which is generally set up for the Mega ST machine.

2. Color monitors - including the SC1224 in all of its incarnations (JVC and Goldstar being the primary vendors). The newer monitor, the SC1435, has a 14" screen and stereo sound.

3. Multisync monitors - these monitors provide monochrome and color access in one monitor. The street price is around $450, about $100 more than a standard Atari color monitor. You need to reset your computer to change resolutions. In many cases, a nice little switch box is provided (or you can build one) which does this for you. Examples of multisync monitors include the OMNIMON RAINBOW MONITOR.

There are any number of monitor choices for those owning Atari TT equipment, although they all boil down to 'multisync VGA'. There 14" color VGA monitor from Atari is quite nice, as is the 19" monochrome monitor. Any standard 14" multisync VGA monitor will do as well. Forget moving your SM124 or SC1224 monitor to your new system, the cabling and electronics is just not going to work.

:PCEM:
How can I turn my Atari ST into a PC emulator?
==========
(Thanks to Shoou-yu Tang sytang@lamar.colostate.edu for this info.)

Supercharger is the only external PC emulator with 8MHz V30 and 1MB RAM in a nice lunch box. It connects to ST's DMA port and defaults as device 3. It's powered by external power supply. Has 8087 socket and one expansion slot. The 1MB RAM can be used as RAM drive by ST when the IBM side not used.

:SPECTRE:
How can I turn my Atari ST into a Macintosh emulator?
==========
(Thanks to Wayne (trek@ihlpb.att.com) for this info.)

Product: Spectre GCR from Gadgets by Small, Inc
40 W. Littleton Blvd
#210-211
Littleton, CO 80120
Retail: $299.95

Description:
The Spectre GCR is a combination of software and hardware that allows the Atari Mega/ST/STe/TT line of computers to emulate an Apple MacIntosh Plus(tm) Computer. The emulation is so good that most Apple software runs out of the package using your Atari Disk drives to read in the Mac software. It does all of this while running 20% faster than the program would on a MacIntosh Plus and provides you a 30% larger screen area.

The Spectre GCR is a combination of software (written by Gadgets by Small, Inc), a cartridge (also from Gadgets), and a pair of 128K Apple ROMs (from either a MAC 512kE(tm) or Mac Plus - part numbers 342-0341 and 342-0342 which you purchase separately from an Apple source.) The Apple ROMs can currently be purchased for around $150. MacIntosh documentation and software, including the operating system (referred to as System/Finder), are also required to round out the package.

The Spectre software is currently at release Version 3.0. Gadgets supplies fairly frequent updates to allow you to keep up with the Apple OS releases. The Version 3.0 update retails for $20. Version 3.0 supports 15 of the 128K OS releases up to, but not yet including System 7 releases.

Spectre software supports Mac formatted disks (including formatting your own) with your Atari drives, Mac sound, large screen displays (1280x960) Mac harddisks via SCSI through a Megatalk board (retail $299.95 from Gadgets) or through an ACSI-SCSI host adapter (my Syquest works beautifully- and the excessive use of disk accesses in Mac software will have you wanting a hard drive). Spectre 3.0 also supports DOS Mounter and Apple File Exchange if you are needing MS-DOS data disks for Mac work. Language configuration support, keyboard support, A4 paper size support for Lasers have also been added to 3.0.

Running Spectre:
The feeling you will get when you see your Atari transformed into a MacIntosh with a decent screen is indescribable. The extra flexibility that you get will also make you feel more confident in the greatness of your Atari. You will also get to see some of the frustrations with one of the other sides of the fence - frustrations like excessive disk access, remembering not to remove/change a disk unless the OS tells you to, etc.

Speaking of changing disks, there are major differences in the operating philosophies of an ST and of a MacIntosh. You really must read the documentation that comes with the Spectre GCR (and I for one found that a real delight. Dave and Sandy have a very different approach to software documentation that makes it enjoyable reading.) You should also read the Mac Operating System docs. One other reference you may need if you are going to do much with Mac software is one of the reference manuals referred to as the MacIntosh Bible.

If you ask an Apple dealer if a particular piece of software runs on a GCR, don't figure you will get a straight answer. They won't know. The current compatibility list from Gadgets lists about 450 programs and their release numbers that have been tried and found to work with Spectre GCR. In general, if a piece of software won't work with the GCR, it is probably becuase of copy protection. Most serious Mac software is not copy protected.

One last note - earlier versions of the emulator exist that were not capable of reading Mac disks directly. It's a capability you will want.

(Thanks to Shoou-yu Tang (sytang@lamar.colostate.edu) for this info.)

Spectre GCR is the best availible, you need to obtain a set of 128KB ROM from Apple (they are used in Mac 512KE and Mac Plus, noted that Mac512 use older 64 KB ROM which is not good) to fully utilize the device. Also it's recommanded to use it with MONO monitor and at least 2MB RAM. The Spectre software takes about 300 some KB of memory, so on a 1040 there is not very much left for Mac, especially after the Mac system is loaded. 4MB memory and MONO is best.
It can read/write Mac disk direct using ST's drive (double side drive, as most Mac drive is double side). With DOS mounter or software like that you can read /write ST, IBM disk from the Mac desktop as well (don't try to run the ST, IBM binary. It's only for file transfer). Or you can use Apple File Exchange to read/write ST, IBM disk.
Syatem 6.0.5 runs fine, system 6.0.6, 6.0.7 runs also. But system 7 will not run with it.

:UPGRADE:
Can/should I upgrade my ST?

The answer depends on the type of ST you currently have, and what you want to do in the future. Be aware that there are a large number of modifications one can perform on the venerable 1040ST, and that newer machines are coming down in cost so much that to obtain a certain feature it may be cheaper to purchase new than to upgrade.

1. Memory - most ST machines may be upgraded to 4 megabytes. The newer STe machines use either SIP or SIMM

2. TOS - for those still running TOS 1.0, now is the time to consider an upgrade. TOS 1.4 has been around for at least 2 years now, and is -much- faster (and safer) for those using hard drives. TOS 2.06 is available as a hardware upgrade to ST and MegaST machines for about $150 from CodeHead

==========
Hope you liked the comp.sys.atari.st FAQ. If you have comments, suggestions, more material, etc., mail me at sourada@iastate.edu

Thanks to David Paschall-Zimbel (davidli@simvax.labmed.umn.edu) for compiling most of this FAQ.

>
>ps. anyone know of a good .cpx and other TT -stuff site ?

ROMRAM is at atari.archive.umich.edu I think. The filename is something like RR_11H. Look in the TT directory.

Dieter Fiebelkorn wrote a collection of CPXs. I don't remember the filename, but it's at atari.archive too. Just search for CPX in the filename.

6957. WANTED: used Atari software

Newsgroup: comp.sys.atari.st
Date: 1992-06-30 17:35:08 UTC
From: (unknown)
Message-ID: <1992Jun30.173508.387@news.larc.nasa.gov>
Source record: 220302

Hi fellow Atarians,
I have been coveting the following list of software titles for some
time. The list also includes the price I would like to pay (roughly half
of street price). Please contact me if you feel me could strike a deal.

```
---------------------------------------------
Tile Price (dollars)
---- ---------------
Arena Earth 8
Bloodwych 10
Bloodwych Data Disk Vol.1 10
Cadaver 15
Cadaver - the Payoff 10
Drafix 1 w/Dot Plotter 50
Driller 8
Golden Axe 15
Hard Driven II 15
HeroQuest 15
HeroQuest:Return of the Witch Lord 15
Infestation 8
Jimmy White's Snooker 15
Knightmare 20
Kight's of the Sky 20
Populous 2 (1Mbyte version) 20
Powerdrome 8
Robocop 3 20
Sliders 15
TCB Tracker 20
Team Yankee 15
Technocop 8
Tower Toppler 8
Pure C for Atari ST 150
Turrican 8

Collections
-----------
Quest and Glory 25
includes Cadaver, Midwinter,
Bloodwych, and Iron Lord
Virtual Worlds
includes Driller, Total Eclipse, 15
Castle Master, and The Crypt
Winning Team 20
includes APB, Klax, Escape from
the Planet of the Robot Monsters,
```

Vindicators, Cyberball

Book

Chaos Strikes Back Maps/Lists 8

That's the list and thanks for reading it.
Daniel Koppen

6958. Help on installing EMACS

Newsgroup: comp.sys.atari.st
Date: 1992-06-30 17:38:59 UTC
From: raycole@matt.ksu.ksu.edu
Message-ID: <12q67jlNNhm@matt.ksu.ksu.edu>
Source record: 220299

HELP! I'm trying to install the binaries to EMACS 18.57 and am having trouble. I'm using EMACS 18.57 with the 8 bit patches applied from a.a. and have uncompressed it fine. As a shell I'm using Gulam and my computer is a 1040ST with no memory upgrade (I know, 1 meg isn't really enough to run EMACS, but its become a point of honor to get this installed.) I have plenty of space on my hard drive, >20meg, so I don't think that's the problem.

What it does is when I run the dump program it all appears to go fine until it tries to make the second xemacs file. When it attempts to do this it reports that its unable to rename xemacs.2. Any ideas on this? I'm at a loss over what to try.

On a side note, I seem to remember seeing Bash 1.12 ported to the ST, but I can't find it now. Where can I get a hold of this? Or was I dreaming when I saw this?

Thanx in advance

6959. Re: New version of QD Play (PLAY.PRG) available from atari.archive

>sounds in programs, however...

I won't touch the issue of getting the source code from Dave, :^) but I would like to see more (some!) sampled sounds in programs. I mentioned this to the Gribnif guys, and wanted them to have some sampled sounds in NeoDesk.

When I saw and heard the Lotus Improv demo on the NeXT, I was truly amazed with the digitized sound, and yet I thought the ST and STE could do this just as well. But why not incorporate small sampled sounds into programs? For example, in NeoDesk, when a disk is finished formatting, a well-digitized voice could say, "Formatting complete," or something similar.

Or course, this would have to be an option because I know that some people out there won't want their computers talking to them. :^) In this case, the program must be modular so that the digitized sounds don't take up more RAM than they have to, for users who don't want that feature.

Moreover, I touched on this in a previous paragraph, the voices and sounds must be well-digitized. If the sounds are scratchy, hissing, and just don't sound good, I'm going to turn off the feature, or not use the program. I don't expect shareware and freeware developers to have professional talent recorded with high-quality equipment to get the good samples, but it's certainly something to strive for. :^)

We now leave comp.sys.human-factor and return you to comp.sys.atari.st. :^)

>beg forgiveness from the net.

Sorry if it seemed fascist. It's not a question of bandwidth, but etiquette. Posting binaries in this group is totally inappropriate and while it may seem stupid to complain about small offenses, the general reason for the rule (as I see it) is that clueless new users may get the idea that posting binaries is OK and will then post Nethack here or something. Why not just send it to atari.archive, or, if you don't have FTP access to the States, lancs pdsoft archive?

Now that many of the archive sites have mail robots, there's really no reason for the binaries group anymore either. It's a tremendous waste of resources to send bits all around the planet when you can send them to an archive once and retrieve them on-demand.

:) above = "parody"

Jeez; I never thought I'd see the day when we'd have a contest over whose cheesy AUTO folder/command line sample playing program was best. You'd think these were demos or something with real value. :-|

>but have you worked out how to calculate
>accurate frequencies yet :-) ?

Come on; is there any real basis for this comment? There are many possible criticisms of QD Play, but I don't see "inaccurate playback frequencies" as one of them, unless you're talking about speeds below 600Hz or something. (Samples that slow are useless anyway.) Seriously, rather than reinventing the wheel you could have mentioned your criticisms to me and I could have changed QD Play to accomodate your needs. That's what Ed Krimen did, and he got a new version of QD Play the next day.

I think I've gotten the Delirious demo to work once and that was it. Don't
worry because you're not missing anything. There's better demos.

6963. Z-modem for MiNT

Newsgroup: comp.sys.atari.st
Date: 1992-06-30 19:10:20 UTC
From: terjeve@ifi.uio.no
Message-ID: <TERJEVE.92Jun30201020@kolsaas.ifi.uio.no>
Source record: 220303

Can someone please tell me where I can get hold of source for a
MiNT-friendly Z-modem package? The one I have uses GEM and is
therefore not very usefull (as I very rarely use GEM).

I've added this question to the FAQ, since I've seen this type of question
many times lately. These two, like a bunch of European ones, assume that
the system is in 50Hz mode, but American systems default to 60Hz. Try
50hzboot.prg, they'll probably work.

>capable of holding its own against ye average 486 - that's TOS/DOS
>comparisons - I don't have ASV so I can't make ASV/ESIX (or whatever)
>comparisons.

Actually a 386-33 with similar features could hold as well as a 486 too.
So whats the point in comparing the TT to a 486 when the TT cpu alone is
close to the performance as a 386DX-33 cpu.

6966. TT system wanted ....

Newsgroup: comp.sys.atari.st
Date: 1992-06-30 20:49:44 UTC
From: baffoni@aludra.usc.edu
Message-ID: <l51i78INN42q@aludra.usc.edu>
Source record: 220311

Hello,

I must apologize for posting this world-distribution, but I was unable to figure out the distribution needed for both USA and Canada at the same time. For those who are not in the USA or Canada, you might as well skip this article.

I am looking for a used TT system. Preferably a TT/4/50MBHD system with color monitor, 3.06, and 1.44MB drive - however I am willing to go with an older model if the price is right. Also if your system is slightly different (ie 8/6 MB) then don't be shy - I'll let you know if it is a problem.

Warranty is not an issue for me as I wish to use the system to do some hardware development (and the warranty will be the first to go :).

If you have trouble "r"eplying to this message, I can be reached at:

baffoni@aludra.usc.edu
or
mbaffoni@skat.usc.edu
or (if all else fails)
(213)747-6804

Thank you.

Mike Baffoni

6967. Mega 4 system for sale!!!

Newsgroup: comp.sys.atari.st
Date: 1992-06-30 22:28:31 UTC
From: c-nims@nwu.edu
Message-ID: <1992Jun30.222831.20484@news.acns.nwu.edu>
Source record: 220315

System includes:

Hardware:
* Atari MEGA ST4 (4 meg ram) (w/kbd & mouse)
* Atari MEGAFILE 30 30meg Hard Disk
* Atari SM124 12" Monochrome monitor
* Atari SC1224 12" Color monitor
* Monitor master monitor switch
* Six switch power center (fits monitor footprint)
* Two Quickshot (I/II) joysticks
* Packard Bell 2400bps modem w/cable

Software:
Midi:
* Master Tracks Pro (Passport)

Programming:
* Mark Williams C 3.0.1
* Mark Williams csd (C source debugger)

Games:
* Lemmings
* War in Middle Earth
* Their Finest Hour
* Dragon's Lair
* Dungeon Master
* Chaos Strikes back
* The Immortal
* Gauntlet II
* Starglider
* Heros of the lance
* Thunder Blade
* L.E.D. Storm
* Blasteroids
* Impossible Mission II
* Menace

Word processors:
* 1st Word & STwriter
* JetExpress HP Deskjet GDOS drivers

Public Domain:
(Gnu C, TeX, graphics/sound demos, etc...too many to list.)

Price:

I'm asking $1195.00 or best offer for the entire package (Shipping included).

Please contact me via email (c-nims@nwu.edu) or call me at (708) 948-7915.

>

NO!!!! Keep expanding it, and maybe update it on an archive site
if it gets to unwieldly! It's turning into a treasure trove of info
but lacks enough detail in some places to get by w/o posting a
popular question to get more info!

It's an excellent start... but lacks flesh in spots!

jc

6969. Spectre CGR for sale

Newsgroup: comp.sys.atari.st
Date: 1992-06-30 22:32:45 UTC
From: c-nims@nwu.edu
Message-ID: <1992Jun30.223245.20608@news.acns.nwu.edu>
